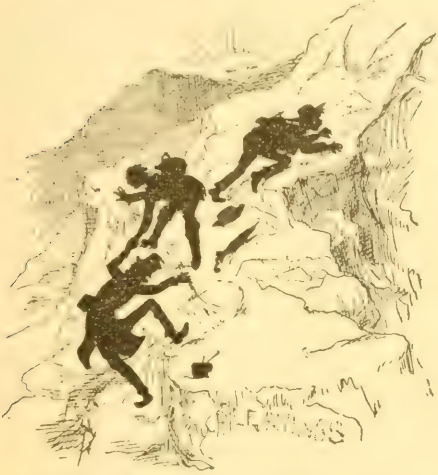
After six hours of climbing, the last summit was scaled with a shout, and we found here a basin several acres in extent, carpeted with a coarse gray sand—disintegrated granite. At one side was a very attractive and beautiful snow-bank, several rods in extent. From a pool in its side we quenched our thirst, replenished our bottles, and indulged in the boyish pastime of snowballing, and this on the 6th of August, when people were sizzling with heat in the valleys below.

After enjoying our sandwiches, snow water, and a restful nap upon the sand, we sought the highest of the three mounts that crown the summit of Grayback, and had a view grand beyond description. To the south we looked down upon the San Jacinto Mountains, and the thriving towns around it. To the east the far-reaching Mojave Desert and the noted Salton Sea; north is a series of mountains and canyons, and away beyond, again, the desert. Over the distant mountains a thunderstorm is bombarding the wilderness, adding to the wildness of the scene. To the west we see what appears to be the blue of distant mountains; but the glass reveals it to be the Pacific Ocean. Our eyes follow down the range toward Los Angeles, and see the crown of Old Baldy, then the lesser Cucamonga; and away down toward the coast is a very prominent ant-hill. We pass the glass from hand to hand, and, "Why!" we exclaim, "that's Mount Wilson." Then we all put our thumbs in the armholes of our vests and smile. "And *that's* Mount

Wilson! What a fuss some people do make over climbing that little hill, and over a good trail too! Why! it looks as though it could be put on a wheelbarrow and dumped into the Pacific! Yes, yes! Los Angeles people must be easily satisfied to climb that little hill and call it grand."



RAMBLER CLIMBING GRAYBACK: NO SIDEWALKS HERE.

Our visit was limited to three hours, and we kept our eyes and imagination busy absorbing the grandeur. From such an elevation one gets a clear idea of the lay of the country and the location of towns, and can imagine the changes to be wrought in the next few years. Upon the summit of Grayback there is no vegetation except now and then a clump of hardy moss. The only life we saw was a butterfly; and not a great distance from the top we saw a honey-bee.

Our descent was by another route, but rough and full of interest. We broke camp the next day, and left the most grand and silent forest we were ever in. Our week's outing had cost us more hardship and labor than a month's work in the apiary; and though the dew rested on our faces while sleeping under the stars, we caught no colds nor rheumatic pains. No especial episode marked our homeward journey; therefore when you eat a watermelon, feed the rind to the horses and remember Mr. Wilder and the RAMBLER.

NOTES ON THE BICYCLE.

THROUGH THE GAS AND OIL REGIONS: A CALL UPON DR. A. B. MASON AND E. E. HASTY.

Some one has said, that "variety is the spice of life," and I am fast beginning to believe it. Good roads, no hills, no mud, no sand, no rain, make touring on the wheel easy but monotonous. Still, if I were to have my way in *starting out* for a day of cycling I should prefer to have no novelties of this sort; but *afterward* it is not so pleasant to look back upon.

You remember that I had left Norwalk after visiting S. F. Newman, determined to make a start, even if it did rain, which it did. While I was on the brick pavement all was smooth sailing. I was told there was only one hill after leaving the pavement, and that a clay one, that would be likely to give me any trouble, between Norwalk and the next town; but *that* hill! After the heavy rain during the forenoon, the mud was about the consistency of first-class soap—slippery and heavy. I will not attempt to give you my experience, but simply state that, on arriving at the top, I concluded there was no poetry in wheeling through the mud. The conclusion forced itself upon me that I must "clean up"—at least dispose of some of the surplus mud adhering to my shoes and the two wheels. After hunting about a little I found a crooked stick. With this I managed to scrape off the great clods of clay from my feet, and then with the same instrument proceeded to push the chunks of mud out from between the spokes. I was finally obliged to finish up with my bare hands. While thus engaged the residents along the street seemed to cast pitying glances, not unmingled with ridicule. All of this I accepted meekly. After the job was all finished I found a nice footpath along the side of the road, and on this I made good time, though I was obliged to run over briers for several stretches with my pneumatic tire, where a hedge fence had just been trimmed. But it was either briers or mud, and I chose the former, willing to take my chances on a punctured tire.

Just before I arrived in the town I observed that I was too muddy an object to go into the town, and too proud to receive the jeers of the "small boy." Before crossing a river I found a chance to go down into the water, and, by the slow process of splashing water with my hand, I managed in time to wash off the mud, and then with my hankerchief I wiped off the wet. After cleaning myself up, I proceeded to go into town, determined that I would take no more road. I next took the railroad track, and pounded the ties — literally so — for nearly twenty miles, some of the time crossing trestle-work. At the end of the day the pneumatic tire showed the effect of the journey, by having horrid gaps in one or two places.

As it was night I put up in the hotel in the town of ——. After a good supper I retired to the hotel office, or barroom. Three men were playing cards, and I was invited to make up the company. I meekly said I did not know how to play. The trio were greatly astonished, and I sat down to read the paper. They cursed good-naturedly over the game to such an extent that it made my blood fairly tingle. I was just deciding to go out of the room, when, in the adjoining room, or ladies' parlor, the sweet strains of "Nearer, my God, to thee,' rang out. A young lady had been practicing on a piano, and she finally turned to this beautiful piece, singing in a strong, clear voice, that wonderful hymn. I wanted to go into that room, where the atmosphere, I felt sure, was purer and better; but I thought it would be intruding, and so I heard on the one side God's name taken in vain, and on the other his name *not* in vain. It seemed impossible to me that the two kinds of sounds could very long continue together in conflict; and finally, to my great joy, the swearing ceased.

The next morning the roads had improved considerably, as the rain had stopped. I made good time without any novelties save now and then the troublesome dog, and finally found myself in Fostoria, 30 miles away. Here I remained for a couple of days, not with a bee-keeper, but with an old chum and classmate, Mr. Geo. M. Gray, printer and publisher. Fostoria is one of the great booming towns of Ohio. It has struck natural gas, and struck it rich, for immense glass-factories have started up, as the gas offers peculiar facilities. On Monday morning I started on my tour again, Mr. Gray accompanying me a part of the way on another wheel. We went through the gas and oil regions, and pursued our journey together as far as Perrysburg. Here Mr. Gray left me, and I proceeded on my way to Auburndale, a suburb of Toledo, where Dr. Mason resides. I landed in a region largely inhabited by Polacks, in Toledo. In making my journey through the country, I had been depending upon the directions given by English-speaking people; but here I was, in a maze indeed. Nobody knew where Auburndale or Wagonworks was, at least they gave me a shake of the head, although I knew I was within a mile and a half of the place; and when I did find somebody who professed to know, he directed me wrong. The result was, I wandered around aimlessly, misdirected for two hours, within a comparatively short distance of Dr. Mason's home. A small boy, also a Polack, hearing me inquire the way, finally gave me directions that sent me straight to Dr. Mason's postoffice. I had begun to mistrust everybody, and did not even thank him for his kindly service.

I found Dr. Mason just coming out of his postoffice. I called to him, but he failed to recognize me at first. Quickly recovering from his surprise, he broke out with "Well, well! where did *you* come from?" I accompanied him home, where he kindly dusted me off and made me look a little more presentable to civilized society. When a chap has been out on the road, covered with dust, wearing a knickerbocker suit, long stockings, low shoes, and a Canadian helmet hat, he feels as if he did not belong to decent society. But Dr. Mason and his family, like all other bee-keepers I have met, cared little for exterior, and I felt at home at once.

The next morning we took a look at the Mason bees. I had brought no veil with me, and, in accordance with my natural instincts, I stood a little aloof; but the doctor, bareheaded, barehanded, and without smoker or veil, proceeded to open up the hives, and ascertain what those bees were doing. "I *thought* they were bringing in honey," said he. "See here," he added, showing me a comb crammed full of capped honey. "These colonies need an extracting." He had been so busy that he had not had time to look them over before then; but he fully resolved to give them an extracting at once. It was after the regular honey-flow, but nevertheless a good supply was coming, evidently from sweet clover. Pretty soon the doctor began to feel for the top of his bald head, and then for his nose, for the bees were beginning to push in their stings at a pretty good rate. He was finally obliged to take shelter in the barn, while I helped him pull out one or two ugly stings. The next time he returned he had on a Thos. G. Newman globe bee-veil; as for a smoker, he would not bother with one for just two or three colonies.

A little later in the forenoon the doctor and I, accompanied by the Mason horse, already mentioned by Rambler, made a short run up to the residence of Emerson E. Hasty, at Richards, O. After making many crooks and turns we finally arrived at a very pretty country home. The first thing that struck me forcibly was a long beautiful double row of maples covering the driveway up to the Hasty house.

Just as we were about to get out of the carriage, our friend Hasty made his appearance. He had been working among the bees, having a veil and a hat on his head, the veil being tucked up under the hat at the time, ready for emergency as we shall see. He had been watering some of his choice flowers, for it was easy to see that he was passionately fond of them. He was growing them in luxuriance all about the apiary, and here and there he showed us some of his choicest beauties.

True to the instincts of all bee-keepers, we finally worked into the apiary; and after we had been there a few moments I rather concluded that the temper of the Hasty bees was nearly as bad as that of the Punics, or Tunisians. In every apiary there are some novelties, or some new wrinkles, and these we examined while the bees now and then reminded us of their presence by a fresh injection of *apis virum*. The view in Rambler's picture (see p. 914, Dec. 1, 1891), of the apiary, is a good one. Mr. H. apologized for the appearance of his yard, adding that he had not expected visitors. Nevertheless the apiary presented a much cleaner and neater appearance than most of them do in the country. After enjoying a pleasant chat we took our departure, and soon arrived at the Mason home.

Early in the afternoon the wheel and I started on our journey on the most direct route to Detroit, some 75 miles away. No novel experiences met me on the way, save once, when I came to a standstill. It was not at the end of the road, but the bridge was down, and the water was clear and deep. I finally espied a raft, and, with fear and trembling, crawled on to it with the wheel. It *just* held us up. By proceeding cautiously I made the other side, and had the satisfaction of landing my Safety in safety. Well, you know the rest. I got into Detroit, feeling unusually well after my long ride.

THAT PECULIAR DISEASE.

ONE WHICH RESEMBLES FOUL BROOD; HOW TO CURE IT.

I see on page 594, August 1, and page 674, Sept. 1, what you say about the disease that resembles foul brood. If you will turn to page 256, 1883, you will there see what Milton Hewitt said. Is this not the same disease? Also on page 398, same volume, is another article from L. C. Lincoln, speaking of something similar. You will also notice what I said on page 461, same volume. I then stopped the disease by giving a new queen. I have since cured quite a number of colonies by requeening them. It will work every time if there is a good honey-flow; but if there is no honey coming in, it will not work so well. I have also cured them with the carbolic-acid solution mixed in sugar syrup, feeding them liberally for a week or two. I also had three colonies affected in the same way two years ago, just before the white clover began to yield honey, and it disappeared during the honey-flow, and has never returned. This present season I had one colony affected. I cured it by simply feeding sugar syrup for about ten days.

By the way, I think bees are something like ourselves—plenty of good healthy food, and something to do, is the best of medicine; and hereafter, in treating the above disease, if the queen is not an extra good one, off comes her head, and I'll replace her with a young one; and if there is not plenty of honey coming from the field I will supply the colony with a feeder. This disease has about destroyed all the bees in box hives in this country. I think it is contagious to a certain extent, but nothing like real foul brood. P. D. Miller.

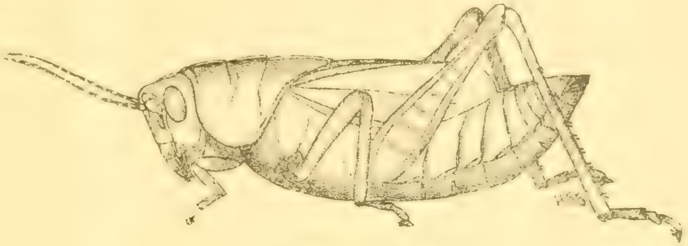
Grapeville, Pa., Sept. 13.

[After carefully reading the references you name, we are not so certain that the disease to which you refer is the same as the one which appeared of late in our yard and in other places; still, it may be the same. In any event it is good policy to first requeen; and, if that does not answer, to do something else.]

A MAMMOTH LOCUST.

SOMETHING ABOUT GRASSHOPPERS IN GENERAL.

The huge locust received through you from S. F. Herman, Tuscaloosa, Alabama, is one of our largest locusts. It is known to science as *Dictyophorus reticulatus*. I inclose a good drawing natural size which gives an excellent idea of this colossal hopper. It is fully three inches in length, black, with obscure reddish reticulations on the tegminæ, as the thick upper wings of such insects are called, and is marked with yellow as follows: A long narrow strip runs the whole length of the body, from the vertex, or top of the head, along the pronotum, as the back of the first thoracic ring is called, and extends the entire length of the abdomen, clear to the tail. On the abdomen this broadens out posteriorly on each ring, so we see a succession of yellow triangles, with the vertex of each in front. The pronotum, the saddlelike piece on the back, between the head and wings, has a narrow yellow border behind. There is also a yellow short line on the front just below the eyes. The hinder margin of each ring, on the under side of the abdomen, is bright yellow, and a broken yellowish white line marks each side of the abdomen. A sober olive-colored ring surrounds the base of the four hinder legs, and lines of the same color mark the posterior thighs. The tegminæ, or upper wings, are short. The under wings are quite small, and are brilliant red, bordered with black. The insect is confined, I think, to the Gulf States, and, like all locusts, feeds on vegetation. I judge it must be a clumsy, awkward species, much easier to catch than the most of our northern species. It is easy to distinguish the locusts, as entomologists call these hoppers, from the grasshoppers. These are usually more robust; are gray, dusky, or black, and have rather short antennæ, as the hornlike organs on the head are called. The grasshoppers, on the other hand, are slim, usually green, and have very long antennæ. The locusts place their eggs in the earth, and are often so numerous as to be terribly destructive. The grasshoppers, which include the katydids, fasten their eggs to plants, and are rarely so numerous as to become very harmful. Grasshoppers and some of the locusts stridulate —that is, make a whirring sound by rubbing the legs against the wings. This noise is heard constantly in late summer and fall. Both locusts and grasshoppers undergo incomplete transformations; that is, they look alike at all ages, but the larvæ have no wings; the pupæ, mere wing-pods; while the adult has complete wings, and is sexually developed. I should like more of these huge locusts, as this is the first one in our collection.

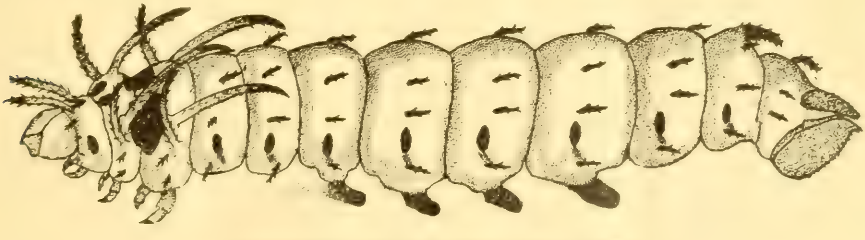


LOCUST—FULL SIZE.

Mr. Jas. P. Brown, Colora, Md., writes me as follows: "I send you by mail a worm, which to me is a stranger. I have been very much interested in your writings in GLEANINGS; and hoping that you may be able to spare time to name and describe this remarkable specimen, I send it to you."

This is even more unique and startling than is the locust sent by Mr. Herman, from Alabama. It is the regal walnut moth. We call it *Citheronia regalis*. I send a drawing which accurately represents this larva, which has been called the "horned devil." It is over four inches long, three-fourths of an inch thick, and is dark green in color. The head and tip of the body are brown. Small black spines, as shown in the figure, mark each ring, while ten large brown spinous hornlike organs, eight of which are very long, are to be seen just back of the head. As the insect throws up its head and waves these horns it looks very frightful, and, though as harmless as a kitten; it would no doubt throw many a timid person, brought up, unfortunately, to fear and dread such animals, into spasms. One is as safe in handling these caterpillars as he would be to handle a flower, which is really no more beautiful or interesting than this larva. These larvæ feed on hickory and walnut. The moth which they produce is a large one, of a rich brown color, striped with drab, and spotted with bright yellow. The body is brown, and bears cross-lines and spots of yellow. It is one of our most interesting insects. A. J. COOK.

Ag'l College, Mich., Sept. 3.



THE REGAL WALNUT MOTH, FULL SIZE.

WHO IS MY NEIGHBOR?

SOMETHING FURTHER—SEE P. 659.

Friend Root:—I think your reply to Mr. F. H. Finch, in Sept. 1st Gleanings, is a little inappropriate. The argument of the farmer straining to pay his mortgage off is hardly to the point. The greatest good to the greatest number is what brings happiness to communities, and communities are of more importance than individuals. Your argument seems to be that the seller of any commodity, no matter whether it be a luxury or a necessity, is justified in getting all he can for it. The coal barons, then, are quite right in raising the price of coal. If the poor can not pay the price, let them go without! You commend the conduct of Mr. France, who tried to buy a crop of blackberries that he might bull the market. The millionaire speculator, then, who makes a corner in breadstuffs is doing a Christian work! The poor may have to pay more for their bread, but what does that matter? I fail to see that Mr. Finch accuses you in his letter of having *cheated* any one, and I do not understand how you can place that construction on what he says. It seems to me that Mr. F. simply makes the accusation that you are a little inconsistent. He would not, I imagine, write as he did to you to any firm of nurserymen or gardeners whose relations with the public were of a purely commercial nature. But it is somewhat different with you. You are fond of sermonizing, and pointing out to your fellows their moral duties. The Christian Endeavorers of your neighborhood are a source of pleasure to you, and no one doubts that your writings do a considerable amount of good; but they also lay you open to a criticism that others, whose religion is less demonstrative, would escape.

Your line of reasoning may be logical, but you ought not to feel hurt because some others view it in a different light. W. E. Money.

Cobham, Va., Sept. 11.

[I am very much obliged to you indeed, friend M., for your kind letter, and your suggestion that friend Finch and I did not understand each other. I did not think of carrying the idea that the "seller of any commodity" might with a clear conscience charge all he can get: in fact, I drew the line fairly, I thought, in my concluding remarks when I said, "If the *farmers* were getting rich, and were proud and arrogant toward the banks and railroad men," etc. You may be aware, perhaps, that I have, at different times during my life, taken up a great variety of industries. In my effort to find work for people to do, I have stood behind the counter and sold a great variety of goods; I have worked in the factory, and I have also worked in the fields. The products of the farm and garden are quite different things from the goods produced by our large factories; and, in fact, they are quite different from flour and coal. These latter are not perishable goods, and are obtained from so wide an extent of country that there is a uniform market price, as, for instance, the goods on the shelves at a hardware store. Now, if a merchant should purchase either coal or flour at a certain price, say a dollar, and charge his customers two or three dollars, it would be extortion, providing, of course, he knew where he could get an unlimited supply at the price mentioned. He would not be doing by his customers as he would be done by.

I hardly need tell you that the products of the garden, and many products of the farm, are different matters indeed. Potatoes are worth to-day in our market from 60 to 70 cents per bushel, and I am exceedingly glad of it. It rejoices my heart every time I see a load of potatoes come into market. A neighbor of mine has, by great care and perhaps some good luck, secured 2000 bushels of nice potatoes. Suppose he should say that 40 cents is enough, and that he believed it to be unchristianlike to take more. If he were to do this it would do great damage and great wrong to hundreds of small potato-growers who are dependent upon their crop of potatoes for the necessaries of life. If potatoes are enough cheaper somewhere else, so somebody can bring in several carloads, and the supply is great enough to keep the price down to 40 or 50 cents, it would be all right; for, to overbalance those who suffer here, there would be a benefit to potato-growers where these carloads came from—enough to compensate.

I heartily agree with your expression, "The greatest good to the greatest number." Friend Finch, however, by his own confession, did a *little* good to a small number, and by so doing did a *great damage* to a *large* number by breaking down the price when it ought *not* to have been broken down. You see, we can not have an established price on garden-stuff and perishable fruits as we can on the goods we find at the hardware stores.

Another thing, there are so many people just now deciding that farming does not pay, and there is such a widespread stampede from the farms into the towns and cities, that real trouble is coming unless the farmer and gardener get some encouragement; and this encouragement must come in the way of better prices. Our own industry of keeping bees is exactly in line right here. The townspeople and others who work in factories can take care of themselves, even if prices do come up, a great deal better than the farmers and gardeners now take care of themselves. Very likely the town and city people will not fall in with my position here; but whether they fall in or not, it is right. If our boys continue to leave the farms and crowd into the cities, and if encouragement offered to those who work in the open air is not increased, our country is going to suffer, not only physically and financially, but it is going to suffer *terribly* in a moral and spiritual way. While I am writing, I tear out the following clipping from the *Rural New-Yorker* of September 17:

> United States Senator McConnell, of Idaho, began his prosperous career by starting a truck-patch in the then Territory and selling the miners cabbages at 75 cents a head, and turnips at 45 cents a pound!

Now, that pleases me. I should like to shake hands with Senator McConnell. If the miners were glad to get his cabbage at 75 cents a head, and turnips at 45 cts. per lb., I think it was perfectly right that he should charge it; and I am glad to see progressive farmers and gardeners look over our country and hunt up corners where there is plenty of money and a scarcity of vegetables. Our good friend J. M. Smith, of Green Bay, Wis., built up a great business by selecting an unpromising piece of land for his garden; but to overbalance this he was so near the mining-camps that he was sure of big prices for his products. Gardeners, farmers, and fruit-growers should have inducements to scatter themselves over the face of the earth; and in one sense I consider them like Christian people—"the salt of the earth."

Thank you for your concluding remarks, friend M. I did not feel hurt at what friend Finch wrote, but I did feel, and I do still feel, that he, by his mistaken acts, was hurting and damaging the interests of a class of people who sadly need encouragement. Our stenographer very justly suggests that those big onions (and garden-stuff in general, when it brings large prices are not really a *necessity*. If people could not afford to pay such prices for the onions, they could buy cheaper ones that did not look quite as handsome, but which were, doubtless, nearly as good; or they could purchase a great variety of other vegetables that were plentiful and cheap. I did not for a moment mean to encourage extortion in the *necessities* of life like flour and coal, especially during a time of unusual public distress; nor did I think of recommending any thing that would help monopolies, trusts, and millionaires; and when I say "the greatest good to the greatest number," I should wish to have it understood that I always mean to be partial to the poor and *hard-working* people. Millionaires do not *need* help and encouragement, as we all know.] A. I. R.

WHO IS MY NEIGHBOR ?

SOME WISE WORDS FROM T. GREINER.

Friend Root:—Your article under this heading, page 659, accidentally comes in my way the second time, and I could not help reading it over once more. Although I have more work of a literary nature on hand just now than I can handle, I can not withstand the temptation to lay my other matters aside for awhile, and send you a few words commenting on the question presented in the article mentioned.

First, I must state, with all emphasis, that the farmer or gardener is entitled to every penny that his products will fetch in an open market. Average farming and average gardening do not pay. I make this statement at the risk of being called a "calamity howler," for the crop reports back me up in it. The average crops, such as given by the statistics, as, for instance, 10 or 12 bushels of wheat, 75 or 80 bushels of potatoes, etc., per acre, can not possibly leave any profits. The man who produces them receives but a fraction of what his labor is really worth in the open market. Specialists in wheat and potato growing, etc., on the other hand, make these crops pay them good profits. Should the latter, then, refuse to accept the full market price for these products, on the ground that their profits are too large for their consciences, depress prices, and make the business still more unprofitable for their less skilled brethren? Nay. Superior skill should find superior reward.

I believe that cheapness of the necessities of life would be a blessing to our people. In fact, prices of all products have a downward tendency, and yet I believe that the soil-worker is usually a little at a disadvantage. If the law of supply and demand alone were to regulate prices, and allowed to establish them on a more natural basis than they are at present, the soil-worker would be enabled to materially reduce the cost of production; and, if he has a level head, and manages things with ordinary skill, to put cereals and fruits and vegetables into the market, even at lower figures than now usually obtained for them, with a better chance of making the business pay. At present the farmer, as a class and a whole, is not making money. I do not know of a single instance of a man who, in the last 20 years, has commenced without money and has accumulated wealth *in general farming*. I know instances of money being laid up by especially shrewd people who made a specialty of this or that crop; but they got only the just reward for their skill and painstaking. Forced vegetable crops can hardly be called necessities of life. They are at least half-and-half luxuries; and people that want them can be expected to pay the full market price for them. It would be foolish in such case to talk of oppression, or taking an unfair advantage of our neighbor. I am naturally of a liberal disposition. I give away a large share of my surplus of vegetables and fruits to neighbors, etc.; but I have no scruples whatever in taking for the products I send to market every cent that the salesman can get out of them for me. Yet I admire the conscientiousness of our friend Finch, of Alabama. Would that we could instill a little of it into the coal kings who got immensely rich when we paid them $4.50 for a ton of coal, and who now force us to pay an extra tribute of $1.50 per ton! Would that Mr. Finch could spare a little of that conscientiousness for some of the Bell Telephone Company, who might give us much better service at one-tenth the present cost, and then amass an immense fortune. Let a little of that conscientiousness go to some of our highly protected manufacturers, too, who are only too ready to take advantage of restricted competition and squeeze the consumer on one side and their employes on the other; a little of it, also for politicians in high and low places, etc. But then, I hardly dare to hope that the millennium will come yet in this century. T. GREINER.

[Well done, old friend. I am verv glad indeed to have you come in and back me up by saying what I wanted to say, better than I am able to say it myself. I want to take exceptions, however, to just one sentence of yours: "I do not know of a single instance of a man who, in the last twenty years, has commenced without money, and accumulated wealth." Of course, this refers to farmers in general. Now, I suppose the difference in opinion will be in regard to the definition of the word "wealth." *I* know of hundreds of farmers who commenced with nothing, and have earned a fair competence by continuing on the farm. It seems to me they have as much wealth as a man needs to make him a happy and useful citizen. I want to thank you especially for the plea you put in for our good friend Finch. I most emphatically indorse it; but at the same time I think he is making a mistake, and wronging his neighbors by blocking the way for them to get the highest market price for their products.]

LADIES' CONVERSAZIONE.

CUTTING OUT DRONE COMB, ETC.

BLACK OR ITALIAN BEES—WHICH DO I PREFER ?

I fear that, in one of my articles to GLEANINGS not long since, I gave a wrong impression about wintering when I said, "The blacker, the better they wintered." Since spring, I think it more the locality that made part of the difference in wintering. Bees that were so situated that they could gather basswood honey last summer wintered better than other bees; and the bees that were kept in and near the basswood timber near us were blacks and hybrids. Again, an apiary of 20 hybrid colonies nearly all wintered near us, when our Italians fared so poorly. On inquiring into all the whys and wherefores, I find they fed them up for winter in pie tins, extending the feeding some five weeks. The long time of feeding caused them to raise brood, while we fed ours up in two or three feeds. Our bees were all old ones that went into winter quarters, consequently they died before they could raise enough bees to fill their places in the spring. Yet I do believe the black here is a hardier one for wintering than the Italian; but the Italian is superior in so many ways that it makes an apiary more profitable to keep them. The pure blacks run so that they are more liable to lose their queens if handled, and it is difficult to find their queens after the colonies have become populous, as they run so badly. We bought a few black and dark hybrid colonies this spring. The queens were very prolific. They filled their hives with bees, but they don't gather so much honey as good hybrids or Italians.

As the old honey of last year is almost as black as tar, we extract each comb before giving to the bees, and we are surprised to see so much drone comb, which we have been carefully cutting out. I don't see how so much drone comb got into our combs, for we have for years been cutting it out, and always watch our combs when being built. Perhaps the hives have been heated, and the combs have sagged. I suspect that was the case with the combs that were built on foundation starters.

TRYING OUT BEESWAX.

Yesterday I gathered up all my scraps of drone combs, etc., and tried them out by heating in our old wash-boiler filled with water, then dipping them out into the wax-extractor, and letting them drain a few minutes, then dipping back, and heating and draining again until I was sure I had got the wax all out. I am sure I save much wax by pouring it back into the boiler three or four times, and heating over. I had 60 lbs. of beeswax, clean and yellow. We have a solar wax-extractor also. The scraps that were rendered by the solar extractor I saved and heated up in a boiler of water, and dipped out into our Root wax-extractor. I got just about one-third as much wax, perhaps not quite, as was taken out by the sun; and each solar extractorful was set and drained several days before emptying. The solar extractor does not render it out half as fast as I thought it would—perhaps because of so few hot sunshiny days this summer.

Colonies that have poor queens, I think, are crosser than those with good ones; also queenless colonies, if large, are much more difficult to handle than after the queen becomes fertile and is filling the hive with eggs. This summer, when I found a full colony queenless I gave it a queen from a nucleus hive, as I do not find queenless colonies work nearly so well in sections as those with good laying queens. The more thrifty the queen, the more section honey is stored.

We had a few colonies quite a distance from the house. I prevented swarming entirely by changing one comb in the center once a week, changing the same comb each time. It is some work, but I don't know that it is much more if any more work than the hivers would be; and then we have that one comb of eggs or small larvæ to build up other weak colonies. The comb at the latter part of the harvest need not be entirely empty of honey at the top of the comb.

Honey is retailing in our home market yet at 20 cents. Our two colonies that gave 90 pounds each, if sold at 20 cents, would have brought us $19.00 already and probably a fall crop; but likely the price will come down to 15.

HOW TO CURE BURNS; TO GET BEES OUT OF THE TOP OF A HIVE, ETC.

To cure a burn, light your bee-smoker and smoke the burnt place vigorously from two to five minutes, holding the nozzle of the smoker as close to the burn as can be borne. The heat and smoke will draw out the fire so it will give no more pain, or but little, though it may blister a little.

When feeding bees, or working with them otherwise, if they run over the top, and smoke is not at hand, if a cloth is thrown over the hive and drawn to one side before placing on the cover it will clear the top of the hive of bees, and the cover may be placed on without killing any of them. Of course, the cloth is left on until some other time, to be removed.

When mixing sugar syrup for bees, put the water into the vessel first, then pour in the sugar, and it will dissolve quicker and not need a fourth the stirring.

When bees are not gathering honey, and one is desirous of working with them, work but a hive or two at a place; that is, skip around, first one side and then the other; and when they get too lively to work, put one quart of sugar to 12 quarts of water, and put it out in some sunny place, in a wooden feeder. The first few times in being fed it will need to be sweeter; but after being taught to go to the feeder they will take it readily in the summer and fall. Last spring they would not take rich sugar syrup from our outdoor feeder. I found I could work with bees so long as I wished to any time this summer, by thus feeding.

I saw it recommended in some periodical, to put thin honey into combs that are filled with bee-bread, and let it stand a day or so, and then rinse it out and place the combs between other combs in a hive of bees, and they will remove the bee-bread. Our bees will remove all pollen gathered in this locality by placing the combs in the hive of bees, no matter whether in the brood-nest or above, or at one side, and the combs do not need any honey poured into them. We had over 1000 such combs to care for after they had many worms in them, although we picked out those we could easily get at, and most of the cocoons, after which the combs were placed in the hives of all colonies that did not have section honey on, and they rid them of all moths and the most of the cocoons and pollen. They cleaned them up beautifully. In those hives that had supers on we set four to six combs in front, and left them there three or four weeks, and they too were rid of bee-bread, as we could see the little round pellets or pills, they ought to be called (perhaps capsules would be a better name), in piles on the board under them. Some of the bee-bread was white from the flour and corn meal fed them in the spring.

Mrs. L. C. Axtell.

Roseville, Ill., Aug. 10, 1892.

A CHEAP PAINT FOR WINTER CASES.

AN INTERESTING EXPERIMENT FOR THE CHILDREN.

I am painting winter cases, and think others may like to learn of a cheap paint. I am using yellow ocher mixed with equal parts of kerosene and linseed oil. A gentleman who uses this for painting barns likes it, and says that it wears well. The winter cases are made of good lumber, and will each contain two colonies. This insures one warm side for each colony. I use a great many newspapers around and over the hives. I like this way of wintering, because they can have the protection so much earlier and later.

BUTTERFLIES.

I will tell the juveniles how they may try an interesting experiment. Look on the milkweeds for a striped worm. Place it under a tumbler and feed milkweed leaves. If well grown it will soon crawl to the top, hang itself by a little web, and—you must watch closely or you will not see how it is done, but you will see a beautiful chrysalis of green and gold. Beneath in a little heap will lie the old skin. Watch the chrysalis and you will see the dark spots of the butterfly's wings appear. In about twelve days the pretty creature comes forth.

I shall try again to induce the bees to take honey from surplus brood-combs. I will take them away until they have become accustomed to living below, and storing there such other stores as are given them. Then by uncapping the honey and inverting the frames in the upper story I think they will be promptly cleaned. Warmth is essential in all feeding.

As the raspberry is an important honey-plant, will GLEANINGS please give an article on its enemies, and how to meet them?

LIBBIE WILLIAMS.

Delavan, Wis., Sept. 17.

HOW MRS. HARRISON KEEPS COMBS FROM THE MOTH WORMS.

In the general round-up of the apiary in the spring there were many colonies that did not answer at roll-call. I cleaned out the tenantless hives and put them into the cellar with their complement of combs. Some of the hives did not become entirely tenantless until quite late in the season, and the bee-moths were on the wing, depositing their eggs. When swarms issued, the hives latest carried into the cellar were issued; and if moths had hatched in any they were the ones chosen.

I looked over the combs occasionally, and did not allow any cocoons to mature; and as the windows were covered with wire gauze, none could come in. I expected to burn sulphur to destroy the grub of moths; but when swarming was over I examined all the remaining combs, and could not find one. This morning, Sept. 7, I could discover none. This storing of combs in the cellar has saved me a great amount of hard work and worriment, and I shall practice it in the future.

Our bees have stored very little surplus honey this season, but are now pushing out lively in the direction of the river-bottoms, and I am in hopes they will secure sufficient stores for the winter.

MRS. L. HARRISON.

Peoria, Ill.

UNCLE TOM'S CABIN OF SPECKLED BEAUTY.

TWELVE MONTHS OF POULTRY LIFE: AN INTERESTING CHICKEN-STORY FOR THE JUVENILES. BY MRS. AXTELL.

CONTINUED FROM P. 702.

After this long talk with mother Biddie we all ran out upon the green grass, and mistress turned mother Biddie out of the coop for the first time since we were put in there. You ought to have seen how glad she was to get out. She jumped and ran and flew with all her might, and came near scaring us out of our wits. Shut in that foul-smelling coop for six weeks, and never let out once, with nothing but corn and corn-meal dough to eat, no nice gravel to eat, that all poultry must have to make them feel well, she said if mistress had kept her in much longer she knew she must have died of disease and vermin; and as she said this, how she did make the dirt fly, scratching and hunting for gravel, and rolling in the dust to rid herself of the parasites that kept us uneasy all night of late!

Mistress Brown came out with a basin of kerosene and water and a whisk-broom, and turned our coop back and gave it a good sprinkling, and cleaned off the floor of the coop, and moved it to a fresh piece of ground, when the rats ran off.

On seeing the rats, mistress said she would set the coop up off the ground, so nothing could hide under it to kill us, which mother Biddie said was a nice arrangement, as it would afford us chickens place to quickly run under when a dash of rain came up suddenly.

When night came, mother Biddie did not want to return to the coop, because she had been kept there so long. She said master Williams would not have allowed her to be shut up a prisoner six long weeks. He used to let all his hens with young chickens out two or three times a week when it was warm and dry; and when the chicks were three weeks old the hens were let out with them every day when not raining. What nice times we did have scratching for worms and bugs, and catching grasshoppers, which made us grow fast! and we were not bothered with hen-mites either, because our coops were sprinkled with kerosene and water quite often, and a healthier lot of chicks you never saw.

Mistress Brown said mother Biddie must go back into her coop, and she threw some cornmeal dough down for us to eat; and when mother Biddie was not thinking she just ran a long piece of stiff wire, some six feet long, with a loop bent up at one end, in the shape of the top of a letter f, and the other end of the rod was bent to form a handle to hold by. Mistress slyly ran the wire up under mother Biddie, and gave it a quick jerk, and it caught one of mother Biddie's feet. Oh my! how she did jump and squeal! and we were all frightened, but it did not hurt her much, and she was put back into the clean coop.

It smelled terribly strong of kerosene for several days, especially at night; but it did not hurt us.

The coop was now high and dry off the ground, and we were glad of that. It had a wide airy crack in the bottom, which I think mistress did not intend to leave. She said she must give us a change of feed, if she wished us to ever get large enough for broilers, as we looked so poor and little. Mother Biddie said she ought to have thought of that sooner, as chicks that are stunted when young will never make so large nice poultry as if properly fed at first. She said master Williams was particular that all his young chicks should have curd made from sour milk; and the corn meal was made up into bread, and baked, for very young chicks. We were occasionally treated to wheat, oats, and buckwheat.

Clara washed out our water-dish and poured in some clabbered milk; but we would not drink it at first; but as we could get no water we soon learned to love it better than water. How we all crowded around it in a pretty little row! Little mistress said, when one head was bobbing down for a drink, other little heads were bobbing up; and, oh how she laughed! We were almost scared at her, she laughed so loud.

She gave us such piles and piles of food we could not eat it all, and old Robinson and his mates got more of it than we did. Sometimes they drove us away and took it all. How we wished we could ask for that box arrangement to be placed in front of our coop, that mother Biddie had when she was a chick, as old Robinson was so big he nearly crushed us when he stepped on us, so eager was he to get our food!

Sometimes mistress Clara would drive him and his mates away, and sometimes she would set little dog Fido on him, and that taught Fido to chase us. Little Bennie, Clara's brother, thought it fine fun to see Fido chase us. He caught and killed two of us, and carried one to the house in his mouth. Mistress Brown saw him have it. and took it away from him and whipped him hard, and showed him the poor dead chick, and whipped him again. After that he never chased us.

One very warm night we went to bed very happy; and as mistress Brown had placed a board up in front of our coop every night since the rats bothered us, it was so warm we got over the hole in the floor, so as to get air, as there were thirteen of us left, more than half-grown chickens, and it was very warm in the coop. The old rat had not forgotten where he could get food to eat, so he thought he would have some more chicken, and caught some of us, and tried to pull us through the hole in the floor; but we were too large to pull through. But he held on to my foot, and, oh how he did hurt! He pulled and pulled, and I squalled, and mother Biddie squalled, and mistress Brown came running out. She said she did not see what was the matter of those chickens, as they were shut up tight in the coop. She knew it could not be rats. She went back to the house, and in a little while another one of us was caught by the foot, and we all squalled again; and so we had our feet caught and bit several times that night.

When little Clara came out in the morning to feed us she said she was so sorry, for Beauty (that was my name) and Tommie had each lost a foot, and one other chick had lost a toe. She told her ma, who came out and examined the coop, and said it was no wonder, as there was such a great hole in the bottom of the coop a rat could almost crawl through. Brother Tommie and I had to hobble around on one foot, and suffer much. Mother Biddie said it was carelessness, thoughtlessness, laziness, and ignorance that caused much of the suffering in this world, and that made people so poor.

Mistress had one coop of downy little chicks, nearly black (as all little Plymouth Rocks are when just hatched, the pullets being the darkest). This coop of chickens was set close to the bees because it was a nice shady place, shady at noon, but had the sunshine morning and evening. I guess she forgot that bees would sting a black chicken when they would not notice a white one; and they will sting little downy chicks worse than when feathered out. The bees stung those little black chicks so badly that it was pitiful to hear them chirp so often, and see them run to the coop with two or more bees stinging them. Sometimes their mother would catch the bees in her bill, and pull them off, and sometimes some of the older chickens would pull them off. Several chicks died from the effect of the stings before the coop was moved.

After a few weeks, my stump of a leg, and Tommie's, got well, and they called us "stumpies;" and little mistress petted us a great deal because we were cripples.

When master Brown worked with his bees we learned to follow along with him, and pick up the roaches that ran out of the hives. We got so tame he rather liked us because we caught the roaches. He told mistress we tagged him around like little dogs, and would run to him as soon as he went down into the apiary. Sometimes he would set his nice honey down. We soon found out it was delicious. We picked into some of his nice combs, which made him very angry and throw sticks at us; but I guess honey tasted just as good to us as it did to him. He said we bothered him ever so much, for he did not dare to set honey down anywhere, because the two stumpies had taught all the other chickens to eat honey, and it would teach him a lesson never to let chickens get a taste of honey.

By this time the weather was very warm, and we were shut up tight in our coops at night to keep out the rats. Oh how warm and uncomfortable we did get! Master Williams called one day to see how mistress Brown succeeded with the pure-bred poultry she got of him. He told mistress that he was not troubled with rats since he took to poisoning them in a box about three feet long, a foot and a half wide, and two feet high, with a two-inch hole bored in the top of each end. He made two such boxes and set one in the barn and one in his shop near his chicken-house. For several nights he put in fresh corn meal. At first they would not notice it; but in a week or so they took it finely; then he mixed some rat-exterminator with it, which they ate, and which must have killed great numbers of them, as they had not bothered him since. He said the lid ought to be locked when the poison is in, for fear of accidents.

He takes old wire cloth, and nails it over a frame that just slips down into two grooves at the fronts of his coops, so his little girl can slip them in at night without his having to look after them, which makes it much cooler for the chickens. As the coops are all set in a row, the little girl is not apt to miss any.

Mother Biddie thought that, as we were getting so old, she would slip away from us. As mistress had not been keeping her in the coop during the day of late, she chose her nest on the ground, and filled it full of eggs before mistress found it. Mistress said, because it was on the ground the eggs would be likely to hatch well, because of the dampness. If people would put fresh earth in the nests when up from the ground, and occasionally dampen them, it would cause eggs to hatch better, as many chicks die while hatching. Mother Biddie said if some careful person would help the little chicks to get out of the shell after it was picked, many chicks might be saved—that is, if the shells did not readily come off; but they must be careful or they will injure the chick. It is the inside lining of the shell, more than the shell itself, that detains the chick. If the shell is cracked and peeled off, and the lining left on, it quickly dries and becomes tough, and the chick can not help itself. This should be carefully peeled off; but if the chicks seem to be hatching all right they had better be left alone.

When mother Biddie was allowed to set this time, mistress set two other hens at the same time. In six days the eggs were tested by taking them all out of the nest after dark; then, taking the eggs one at a time between the thumb and forefinger of the right hand, place them in front of the blaze of the lantern, and shade the light with the other hand. The unfertile eggs will be clear, and the fertile ones will be dark, with an air space at the large end. There will be some you can not determine whether they are fertile or not, and should be tested again on the thirteenth or fourteenth day. The fertile eggs may now all be put under two hens. They will hatch better than if the unfertile ones are left in the nest. As they contain no embryo chick they have no warmth of themselves. If all the eggs are fertile, the heat is greater, which is very important early in the spring.

If more convenient, and the hens are wild, the eggs may be tested in the daytime by holding them in the left hand, or in an egg-tester, and looking toward the sun.

Do not neglect in midsummer to use the insect-powder from the sprayer two or more times while Biddie is sitting, as it is very easy to use it then when she ruffles all her feathers up. **Mrs. L. C. Axtell.**

Roseville, Ill.

Concluded in next issue.]

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

REARING QUEENS ON DOOLITTLE'S PLAN.

We have had pretty fair success this season in having queen-cells drawn out from cell-cups above excluders, as per Doolittle's book on queen-rearing. We find that, first, the colony should be very strong; second, with a frame as shallow as the Simplicity the stories should be three high, confining the queen to the lower story, and placing the prepared cell-cups in the upper story; third, that some colonies will accept and complete these cell-cups, while others, in apparently the same condition, will not. We would advise those who have tried and failed, to try different colonies until they strike the right one, and then they can keep them at it all summer, provided there is honey coming in; or supplying food would likely answer the same purpose. One colony has built the most of our cells this year, sometimes bringing on the second set when the first had been sealed, and, again, working on others while queens were hatching in the nursery just alongside. This has, however, been an exceptionally good season for this kind of work here; for, while there has at no time during the season been any considerable flow of nectar, and consequently very little surplus secured, there has been scarcely a fair day that bees did not gather sufficient nectar to keep up brood-rearing in full blast. Nearly all of our queens thus reared have proven to be of good size, good color, and prolific layers so far as tested.

Bluffton, Mo., Sept. 17. **Miller Bros.**

[Your experience agrees substantially with ours. Some colonies will do fairly well at building cells, while others will seemingly refuse to do the work at all. Those that would build cells did better when they had an extra super between top and bottom story. We do not know whether any one else has observed it; but queens raised *a la* Doolittle were smaller, nor could we succeed in getting large queens from any queen-mother by that plan, although we could produce them of any shade of color desired.]

AN ARTIFICIAL WATERING-PLACE AFTER NATURE'S WAYS.

Observant people will notice that bees, while drinking at a branch or pool, never sip the water, but abstract it from the sand close by, through which, by the way, it has filtered by capillary attraction. Trying always to get close to Nature's ways I built me a watering-place for my bees. A trough of wood 14 inches square and one inch deep was filled up with clean sand, and a three-gallon demijohn filled with water was inverted over it, its mouth resting on a thin block half an inch under the sand. The surrounding sand soon absorbed moisture, and little air-bubbles could be seen, displacing slowly the water in the jug, as the water in the sand exhausts. By scooping out a little hole in the sand, enough water will gather to furnish the poultry. Put syrup in the vessel, and you will have the best outside feeder I know of, for there is no end to the extent of the sand surface you may use, and the sand does not foul, as water or syrup would if given alone. In order to introduce this to the bees I put a piece of comb honey on the sand. After they had carried off the honey they looked about for more, and, discovering the water, have found out that it is a near and good thing. The principle of this watering-device is well known, but I have not heard of the use of sand in this connection. Please give this a trial, if you have not such already in use, for there is nothing new under the sun. To hold up the jug or bottle, bore four holes in the bottom board, and put in pegs, or, better still, nail a half-hoop of tin or strap iron against a wall or board fence, and put the jug mouth down through it. **Arthur T. Goldsborough.**

Washington, D. C., Sept. 1.

UNSCIENTIFIC SCIENCE ABOUT BEES.

Friend Root:—I send you by to-day's mail a marked copy of the Santa Paula *Chronicle*, Sept. 2, containing some of the teachings of Mr. Archer, formerly the king bee-keeper of Santa Barbara County. He retired from the bee-business, and went into horse-doctoring a few years ago. Since coming to Ventura Co. he has collected a few colonies of bees, and made his celebrated "Mammoth" hive. He exhibits at the two last county fairs, and uses the same colony and hive at the district fair held at Los Angeles. Now, you can readily see how Langstroth, Quinby, Cook, and soon yourself, have, after all your study and research, never tumbled on to the racket of changing worker brood to drone by simply turning the combs around. This discovery was reserved for Mr. Archer, the sage and horse-doctor of New Jerusalem, in this county, to give to the world through the *Chronicle*.

Santa Paula, Cal., Sept. 12. **Jno. G. Corey.**

[The following is the extract to which friend Corey refers:]

We were especially interested in the exhibit of bees, and a new bee-hive by J. Archer, of New Jerusalem. Through the glass the honey-makers can be seen at work. We have read much about bees, but Mr. Archer gave us some information we never had before. He says before the young bees hatch out one can tell if a certain cell will produce a queen or a worker by the shape and position of the cell. If a few days before the young bee comes out you turn the cell about, reversing the ends of the cell you change the sex of the bee. He says during the incubation process the workers keep hovering over and about the cells of the young, keeping them warm as assiduously as a hen keeps her eggs warm in the nest before they hatch.

[Some of our older readers will remember Mr. Corey as the one who shares equal honors with Norman Clark in having introduced simultaneously the principle of the cold-blast smoker. The specimen of bee-lore from the *Chronicle* is a good deal like the information we get sometimes from some of the old "know-it-all" veterans. However, it is barely possible the reporter got things badly mixed (as indeed they do sometimes in trying to report facts regarding bees), and therefore Mr. Archer *may* be innocent of such a gross perversion of facts. Whichever way it may be, it is a piece of nonsense that we do not desire to go the rounds of the press unrefuted.]

HOW BEES SEND OUT SCOUTS PREPARATORY TO SWARMING.

I had my hives all placed on stands in rows, three rows, five in a row, but only two colonies of bees. They had all either empty frames or frames with foundation in them. My bees were Italians, well marked. May 25th there were quite a number of black bees flying around my hives. Next morning more came and kept at a certain hive, flying in and out. About 10 A.M. they went away; but about 11 there was a roar in the air, and, behold, a swarm of bees tearing through the orchard and piling into that particular hive. This scene was enacted in all four times – May 26, 31, and June 12, 21. Every time it was the same thing — first a few strange bees around *all* the hives; then more bees around *one;* next, no bees for a half or a whole hour; then the roar of the swarm through the woods. It was so regular that, on June 21st, I had visitors, and told them to wait, as I was going to get a swarm of bees in a very short time, and, sure enough, within one hour they were there and at work. If this is not proof enough that bees send out scouts, I do not know what more is required; besides, my bees are Italians, and the new comers in every case were blacks.

Adrian J. Hesse.

Bayshore, Long Island, Sept. 13.

HONEY FROM TANWEED.

Prof. Cook:—If it is not asking too much, will you please give me the botanical name of the plant, sections of root and branch of which I send you? On cultivated ground it blossoms rarely, though it seems to thrive in every other way; and when once established it is almost impossible to exterminate it. Single roots are often found 30 ft. in length, seldom going deeper in the soil than 6 inches. At intervals of two or three feet, each root sends up an independent plant. In swampy land covered with a few inches of water it blossoms profusely and yields a fair flow of honey nearly every year, from the last of July to the middle of September. The honey is very light amber, and on the market it is mistaken for white clover. It is rich, and finely flavored. The local name given to the plant here is tanweed. It has been used quite successfully in the preparation of leather.

I am harvesting a heavy crop of beautiful honey this season, entirely from this source. I wish to put it on the market branded with its own name, and, if possible, establish a reputation for it under true colors. F. M. Crane.

Little Sioux, Ia., Sept. 6.

[Prof. Cook replies:]

I inclose Mr. Crane's letter, as it is of no small importance to get these new honey plants recorded. This proves to be another of the polygonums, or buckwheat family, and so is related to heartsease, smartweed, etc. This is *Polygonium Muhlenbergii* The flower looks much like that of smartweed, and heartsease in form and color; but the leaves are much coarser and larger. We see from Mr. Crane's letter that this is a very fine honey-plant. The honey, like that from the willow-herb, is light-colored, which is not usually true of honey secured from autumn flowers. In a recent trip to Northern Michigan, both sides of the straits, and through all the Northern Peninsula, I saw acres of willow-herb in bloom. The wild bees were swarming on it; but there was a great scarcity of honey-bees. I did not see one north of the Straits of Mackinac. A. J. Cook.

Agricultural College, Mich., Sept. 10.

TWO TEXAS APIARIES; DIFFERENCE IN HONEY CROPS.

Mr. Root:—In answer to my advertisement last winter I employed J. P. Watt, of Garnett, Kansas, as apiarist, and turned over to him two apiaries, one located in a valley near Little River, containing 18 colonies, and Rattlesnake apiary, on Pond Creek, of 107 colonies. From the Cameron apiary Mr. Watt sold 100 sections, partly filled, and reported that thieves had gone through three colonies. From Rattlesnake apiary he extracted about 935 lbs. and about that amount in supers ready for the extractor, which will wind up the season with fewer colonies than he opened with last spring. I never failed to get a paying crop from Rattlesnake apiary before. I also employed Frank Morton, a novice in bee culture, and a native of Texas. I gave him charge of Little River apiary, consisting of 96 colonies, located 12 miles southwest of Cameron, and similarly located as Rattlesnake apiary, on a valley with a wide bottom, and commonly known in the Southern States as swamp. On the south is a high rolling mesquite prairie; on the north a wide bottom. The two apiaries are about 26 miles apart, and almost identically located, with a little more chaparral and cactus on Pond Creek than on Little River. The Little River apiary has this advantage, if advantage at all (which I doubt): an abundance of live oak along the breaks of the river about one mile from the apiary. Morton increased Little River apiary from 96 to 104 colonies, and has extracted 5500 lbs., and 1100 lbs. in supers ready for the extractor and a honey-flow at the present writing. Rain has fallen in the locality of each apiary about the same. Will some of the Texas bee-keepers account for the difference?

I have known my Little River apiarist from a boy, and believe him to be truthful. He makes the following unreasonable statement: He says that he extracted from one colony, on July 1st, of three stories and eighteen frames, 121 lbs. of honey, and reduced it to a two-story. July 10th he extracted 55 lbs. August 10th he extracted from 9 frames 55 lbs. Total, 231 lbs. He also says that he will get another extracting. I wish to know, and I hope the bee-keepers of Texas will not all answer at once, or before a fair test—can a three-story hive (a hive with two supers) support more bees and supply more honey than a two-story hive, and about how much more? I have been a continual subscriber to Gleanings for the last 11 years; and from its teachings, and from the A B C of Bee Culture, I have been able to produce tons of honey. Long may it live. E. Y. Terral.

Cameron, Tex., Sept. 8.

[A three-story hive, if it is proportionately populous in bees, will produce more honey, other things being equal, than a two-story colony. The former must, of course, have a good prolific queen, preferably nor over two years old.]

A BEE-KEEPER WHO SECURED A LARGE CROP.

If you will put yourself back to the time when you were at our convention you will remember me as the last one that came, having come all day long through mud and mire to see the editor of Gleanings. Well, as I said then, I had just requeened my apiary from an imported mother, and here is the result: I increasen from 180 to 250; shipped to Chicago 350 60-lb. cans; sold around here 50 60-lb. cans; have on hand 34 60-lb. cans. Shipped to Chicago, 370 lbs. of wax; on hand, 300 lbs. Hives are all full, and I may get from 50 to 100 cans more this fall. John Nippert.

Phœnix, Ariz., Aug. 27.

THE HOFFMAN VERSUS THE SIMPLICITY FRAME.

I want to say a good word for the Hoffman frame. I have a few Simplicity hives with thin-top-bar frames, and a few Dovetailed hives with Hoffman frames. I mixed the frames a good deal; and in hives where there were some of each, the Simplicity frames would be covered with burr-combs, while the others were perfectly clean on top. J. T. Shackelford.

Napton, Mo., Sept. 12.

[Your experience is but that of hundreds of others which we have seen. The non-burr-comb frames have come to stay.]

THE STINGING-BUG.

Mr. Chas. Blackburn, Lamont, Ia., sends me several specimens of the stinging bug, *Phymata erosa*. See my "Bee-keepers' Guide," for description and eight illustrations, showing its strange anatomy. They have been quite common here this year. They hide in flowers, especially goldenrod; and when the bee comes for pollen or nectar it finds it is taken in, as the bug grasps it with its jawlike front legs, and then spears it with its very sharp beak. This last is so strong and sharp that the little bug can hurt us not a little; hence the name, stinging-bug. I do not think they usually do very much harm; but when so numerous as Mr. B. finds them—fifty on one flower—they will destroy large numbers of bees.

Bees are now gathering rapidly from goldenrod. A. J. COOK.

Agricultural College, Mich.

THE BEE-INDUSTRY IN UTAH.

I have been seven years a bee-keeper, but this is the first time that I have attempted to write to any of our bee-journals. I wish to express many thanks to you, and to give yourself and Prof. Cook the credit which I think is due you for the grand send-off which you helped to give the bee-industry in Utah last winter. We have kept the ball rolling, and the interest is still growing. We have organized a territorial and several county associations. A number of meetings have been held, making bee-men more acquainted with each other. Some good has been accomplished, which may produce greater results in the future.

THE CAUSE OF SWARMING.

In GLEANINGS, p. 613, Dr. Miller asks what is the cause of swarming. While there may be several causes, I think the principal one is overcrowding, or lack of room in the hive. I work my bees on the dividing plan, and they do not swarm. I have not had a swarm come out in two years; in fact, when I do not neglect them they don't swarm at all. E. S. LEVESY.

Salt Lake City, Utah, Sept. 8, 1892.

DRINKING COPIOUSLY AFTER VIOLENT EXERCISE.

Friend Root:—I have just read GLEANINGS for Sept. 1st. Please don't drink so much *cold* spring water. Warm it a little, and then drink all you want. When your liver gets to working as it should, you won't look on the dark side of things so easily. A well-regulated liver leads one to see every thing in its best light. An old doctor used to say, that the liver is the "root of all evil." I guess bilious people think so. Don't you? F. A. BLAKE.

Rochdale, Mass., Sept. 5.

[Thank you, my good friend, for your timely caution and suggestions. I can not discover that drinking great quantities of water while riding the wheel has ever done me any harm. But perhaps I should add that I rarely drink even so much as a teacupful *at one time*. Day before yesterday Ernest and I went on our wheels about nine miles to a mission Sunday-school. We made the distance in a little more than an hour. Before going into the school I expressed a wish for some water. He objected; but as I was at once called upon to speak I asked for a glass of water. A boy soon brought a pretty good-sized goblet full. I drank it all by drinking four times, three or four minutes elapsing between the times of drinking, and I just felt good and happy. My experience is, that water taken in this way never does *me* any harm. While riding on my wheel continuously I drink great quantities by taking, say, half a teacupful at a time. May be I drink perhaps a quart in this way; and if the effect of this is to wash out and cleanse out the liver, I am quite ready to accept your explanation. I do not care for *very* cold water; but that from our soft-water springs has generally seemed about right.]

RUNNING UP PRICES ON HONEY.

Advices yesterday are that commission men were buying all honey available, for the purpose of raising prices to 25c retail. I have very little trouble in selling at this price for comb, and $1.75 per gallon (12 lbs.) for extracted, to consumers; but I am producing *thoroughly ripened*, best quality at this price. This spring, while transferring a box hive I had occasion to take out several pounds of unripened honey. I ripened it in tin pans exposed to the sun until it was thick, and sold half a gallon to a neighbor. I did not like it, neither did mother, and the neighbor complained of its having a rank flavor. It was from white clover. I afterward sold him five gallons of thoroughly ripened honey, and they were delighted with it, for they ate it up a month ago.

GEO. E. FRADENBURG.

Kansas City, Mo., Sept. 16.

[We must confess that we have seen nothing in the papers to the effect that commission men were trying trying to make "a corner" on honey. If true, it is good news, because honey is so scarce this year that prices ought to rule higher than last year.]

REPORT FROM O. M. BLANTON.

The cold spring, rainy summer, and overflow, cut the honey crop of Arkansas short 40 per cent. On the Mississippi side we had no overflow, the 300 miles of levees remaining intact, and our shortage of crop will be about 25 per cent. If I can get time I will try to write you up the honey season and incidents of the overflow.

I don't use tobacco, and I long ago quit any beverage that has alcohol in it whatsoever, and not to win your smoker, either, but solely for the good of the constitution.

O. M. BLANTON.

Greenville, Miss., Sept. 1.

HOW TO TEST SILVER IN ORE.

Tell our Missouri tin and silver miner that the following blow-pipe analysis will answer his purposes: Pulverize in a morter 8 oz. of ore to a fine powder; place it in a glass or porcelain vessel; cover it with C. P. nitric acid; keep away from its fumes and let it stand an hour, or over a night is better; then dilute with one gallon soft water; add 2 oz. common salt. If you have any silver in your ore, this water, on the addition of the salt, will at once become milky, and finally settle on the bottom as clabbered milk. Pour off the water and wash this residue until neutral. Place this curdy mass in a glass vessel again; cover well with C. P. muriatic acid; place in the acid also a strip of zinc 1x3 in., which will efferversce as it is dissolved, and a gray precipitate will be found on the bottom. Collect this in a small cavity of soft charcoal; add an equal amount of powdered borax as a flux; now with your alcohol-lamp and blow-pipe direct the flame on the mass for a short time, and, if silver exists, it will appear in little shot form, dancing about like fairies at the bottom. If tin exists it will be in the residue as putty powder. J. P. MURDOCK.

Oxford, Fla.

A POOR SEASON, BUT A GOOD FALL FLOW.

This has been one of the poorest honey seasons that I ever saw in this locality. I had 1100 lbs. surplus from 50 colonies, all of which is of a fine quality. The bees have been getting enough honey from goldenrod to keep up brood-rearing at a lively rate. At present they are filling their combs with honey from the asters; and if they have a few more warm days they will have enough to winter on.

Dilworthtown, Pa. H. P. FAUCETT.

By all means let us have a union as spoken of by Mr. McIntyre. If it had such an effect on the syrup-trade, why would it not have a similar one on honey? You may count me one to help. O. H. HYATT.

Shenandoah, Ia., Aug. 22.

A POSSIBLE SOLUTION: MILKWEED.

I think the bees that Wm. Miller speaks of as trying to carry each other off, on page 622, were fastened together with milkweed pollen.

New Hampton, N. Y. E. E. HOWELL.

HIGH-PRESSURE GARDENING.

BY A. I. ROOT.

PEAS IN THE FALL.

All along during the spring months I kept planting peas without getting enough of a crop to pay for seed and picking, even though we got high prices (none sold at less than 10 cents a quart) for them. Well, although I never succeeded very well in getting peas in the fall, I kept putting in seed of the American Wonder clear up into August; and during the whole of September we have been having the nicest American Wonder peas we ever had in the world. I suppose it was owing to the many cool nights, with almost a frost several times. For a long while we disposed of all we could pick, at 10 cents a quart; but finally we had to come down to 8 cents, and finally the bulk of the crop went for 5. A. I. R.

THE MAN-WEIGHT CULTIVATOR.

Mr. Root:—Do you find the Man-weight cultivator to be what the manufacturer claims for it? I bought one of the double-wheeled ones, and it will not stand the work where there are stones. I find the cast parts are very brittle, and the screws that are intended to hold the hoes are entirely too light, and break before I can get them tight enough to hold. I wrote the Everitt Co., stating that I thought they ought to make the machine good or else refund my money. They did not answer me.

Our bees have made some surplus honey from buckwheat. The honey crop in this vicinity will be a light one. P. SUTTON.

Exeter, Pa., Sept. 7.

[My experience has been quite like yours in regard to the cultivator; but the Everitt people have replaced the weak parts of my original machine. It now does fairly well where the soil is sufficiently mellow, and free from stones, etc. Their claims in regard to it, however, are greatly exaggerated. As there have been quite a number of complaints, to the effect that they do not answer letters, I think it is no more than fair that the public be notified.]

A STRAWBERRY REPORT, AND SOME VALUABLE SUGGESTIONS.

The strawberry crop here was about one-fourth of a good crop. Bubach did nothing. What few berries there were, rotted before they ripened. Warfield and Crescent were the best. I do not think it was because the blossoms were not fertilized enough, because beds that had the fewest plants that have the perfect blossoms had the most and best berries.

On the bed I set out this spring I picked off all perfect blossoms and let the others blossom, thinking they would not have any berries on; but if I had taken up all of my Bubachs and set them out I should have had an immense crop of fine berries. Now, what do you think of having the perfect-blossoming kind to make the imperfect bear?

In the spring of 1891 I bought 250 Warfield plants, and saved only 35 of them. From them and their increase I picked 65 quarts of berries, besides selling a good many plants.

I have a hotbed that I heat with a stove. The wood I use is half-rotten stumps that I grub out, which would not be of any use if not used in this way. It is 4½x24 feet; from this I sold $37 worth of plants.

I had some clear sand and manure that the hens had mixed together, and thought I would try some of it for transplanting in; and, how the plants did grow! They grew more than twice as fast as they did in the well-enriched garden soil I was using.

I shall use sand and manure mixed together entirely next year. I let the hens do the mixing, as they can do it better than I could.

Brodhead, Wis. P. H. FELLOWS.

[Friend F., perhaps we may remind you that many of the berries classed with the imperfect varieties produce some perfect blossoms; and the Warfield has at times shown so many as to be almost worthy of being called a perfect-blossoming variety. Your plan of getting a rich compost for plant-beds is tiptop; and by the use of the sand you kill two birds with one stone—you keep your poultry clean, tidy, and healthy, and have one of the best fertilizers made and mixed by the hens. They can be easily induced to scratch and mix the dirt up cheaper than anybody can do it with a rake. Some of us have learned this to our sorrow.]

MULCHING AND WATERING STRAWBERRY-PLANTS.

I would say that I was well pleased with the strawberry book you sent me; but I would advise friend Terry to revise it some; for, if I had followed directions closely I should undoubtedly have lost all the plants you sent me. On page 27 he says, "Do no watering or covering," so I tried about ten plants according to directions—"no watering," and lost every one of them; the rest that I watered every evening are all growing and doing finely. I suppose he intends this for spring planting only; if he does, he should say so. G. J. STURM.

Mount Erie, Ill., Sept. 12.

[Thank you, friend S. Very likely you are quite right about it. Friend Terry, you know, practices spring planting exclusively. In my directions for fall planting with the transplanting-tubes, you may remember that I advised quite heavy watering.]

WINDMILLS FOR ELEVATING WATER FOR IRRIGATION.

Friend Root:—I am gardening two acres of ground, and have lost two crops of celery on account of the drouth, besides other crops that were short on the same account. My garden lies on the banks of a river, and the water must be raised 24 feet, so that it will run on the highest ground. What sized windmill would I need? also, what sized tank will be needed to hold a surplus, in case the wind does not blow for a day or two. I am not able to run any risk in experiments, so I thought I would come to you for advice, which you might give through

GLEANINGS, and may be help others as well as me. We have not had any rain since the fore part of July, and every thing is dried up, or nearly so. F. W. MOATS.

Brunersburg, O., Sept. 6.

[Friend M., yours is a problem that is coming up now a great many times. If you depend on wind you will need a very large reservoir to hold the supply when the wind does not blow; and even for your two acres I would suggest a tank holding from 1000 to 2000 barrels. Now, if there is always running water in that river I would suggest, instead of a windmill, a tide water-wheel. This would always be available, and only a very small reservoir, or none at all, would be needed. I have seen such water-wheels for elevating water; but I do not think that I ever heard of their being offered for sale.]

PREVENTING WASH ON THE HILLSIDES, ETC.

Mr. Root:—On page 704, Sept. 15th, you have given a nice picture of a land-leveler and two nice rolling hills nicely laid out to drain the water by circles; but you have made one little mistake, and you may as well have it *right* as not, while you are at it. Remember, there never were two hills unless there was a hollow or depression between them; and down these sags, or hollows, is where the water should run. But if there is not *enough* of these hollows running up the hill to carry off the water without leading it, say, over two hundred yards, each way from highest point, as you indicate, then you may and *should* run those straight ditches up the hill; but not *all* of them entirely up to the top, as one or two are enough to go *all* the way up—say one on each side. J. W. DAY.

Crystal Springs, Miss., Sept. 24.

[Thanks again, friend Day. Since you mention it, I do remember that your waste water was finally delivered into the natural water-course, or gully, between the hills, but I did not think to mention it. On our ground, where we have been doing the work it is on a hill so large that we have, in place of a hill, only sloping ground; and wherever there is a depression I have found it convenient to locate these waste-water ditches straight down the hill; neither did I intend, in our illustrations, that these waste ditches should *all* go to the summit of the hill. The idea and plan of working is somewhat complicated at best, and the diagram which you refer to was more to give a general idea of the work to be done than to show just *how* it should be done in practice. I suppose *none* of the up-and-down ditches need run clear to the summit of the hill. During the tremendous rains of the past season, however, a large quantity of water would accumulate on a very small area, even on a hilltop.]

CORRECTED AND LEFT BEHIND BY ONE OF THE WOMEN-FOLKS IN THE MATTER OF ONION CULTURE.

I was surprised to read in GLEANINGS, Sept. 1, that the Egyptian onion did not produce bulbs with you. I sent for a quart of your Egyptian onion-sets last fall, and planted them in poor sandy ground, covering them with rotten buckwheat straw which was left on in the spring—no other fertilizer but the water I had to carry out of the stable after a hard rain, which I put between the rows. They will average the size of turkey-eggs. The strip of paper just meets around one of the largest after the outside was peeled off.

Lochiel, Wis. MRS. MELA HALL.

[Well, my good friend, I am rejoiced to find that I do not even *yet* know all about the Egyptian onion. The strip of paper you send us is just 8 inches long. We have succeeded some seasons in getting tolerable bulbs from the Egyptian onions when given plenty of room on very rich ground; but we have never yet succeeded in getting any so large as yours. We shall have to change or modify our description of the Egyptian.]

GETTING ONION-SETS TO STAND WINTER WHEN PLANTED IN THE FALL.

Friend Root:—Perhaps my experience in wintering over onion-sets may be of a little benefit. I have been raising Silver King onions for the past four years. They were a perfect success three years, and one crop was a complete failure. I sow the seed early in the spring, quite thickly for the sets, and I do not set them out in the fall until about two weeks before the ground freezes. The object is, to have them get thoroughly rooted, and have very little top before winter. One year I set in September, and lost the crop. Mulching is of no benefit on my soil—a sandy loam. I shall try the Pearl onion this fall, as this class of onions brings double the price of any other in the market.

EUGENE DAVIS.

Grand Rapids, Mich., Aug. 24, 1892.

[Many thanks, friend Davis. In order to test this matter, last season we planted the American Pearl sets in the middle or early part of September, then some more two weeks later, and so on until only a short time before the ground froze up. Those planted earliest did altogether the best. They took root and grew, and seemed to go down into the ground far enough to stand the frost. We are very glad indeed to get items of experience from the originator of the Grand Rapids lettuce, now so well and widely known almost over the whole world.]

STEAM HOT-BEDS.

We are putting in 15,000 feet of double-thick glass this year for cut-flower growing. That makes my plant 36,000 feet. We expect to heat one-fourth acre of hotbed on A. I. Root's plan of steam. GEO. M. KELLOGG.

Pleasant Hill, Mo.

NOTES OF TRAVEL

FROM A. I. ROOT.

TEMPE, ARIZONA.

When we arrived at the station, the principal object that took my attention was an Indian pacing up and down the platform, with a tuft of feathers on his head, like the pictures we see in the geographies and other books—a veritable painted and feather-decked Indian. I confess that I looked up to him with considerable respect. He was quite a good-sized, tall, well-developed man, and I concluded that he must be a chief or something of that sort, as he, with a sort of indifferent air, seemed to look down upon the rest of mankind who hadn't any nice feathers like his own. When I began to inquire of my brother and his family about this "big Injun" and his feathers, I noticed that they seemed to smile among themselves at my exalted conception of the "red man of the forest;" but as we did not think alike, the subject was dropped. But they smiled in a sort of self-complacent way that rather vexed me just a trifle; but, with very pleasant good nature, they told me to keep on studying the habits of these dusky friends of mine. Well, about the first thing I saw when I looked outdoors, after I had begun to feel at home, was this same tuft of feathers bobbing about over a pile of garbage that had been dumped out in one of the alleys of Tempe. He was poking over the trash, thinking he might find something to eat, or pick up some broken dishes, or something of the sort, to carry home. I was astonished. My hero of the feathers had taken a sad tumble. Afterward I saw other Indians picking up dirty, nasty feathers from dust-heaps in order to stick them in their hair in a like manner. These Indians are human beings; they are God's children, like ourselves; but what a difference education and surroundings make! If a white man should fix up his hair in that way, and deck himself with feathers, and then parade the streets in order to attract attention, we would decide at once that he was stark mad —downright crazy, and very fit for the asylum. But these Indians are not crazy at all. It is only because they look at things in a different way. Some of them can chop wood, and are quite expert with an ax; but they do no regular work. In fact, they rarely work at all unless they take a fancy to a special dress or some extra fine feathers. The whole race seems to be in a state of childhood; but yet now and then we have occasionally a character that shows the possibilities that lie dormant and undeveloped under that dusky skin. One might think, when the Indian looks upon the whites, and sees the progress we have made, that they would feel sad and discouraged. From what I can learn, however, it is just the other way. The Indians, both men and women, especially the most ignorant and savage, seem to feel themselves far above us. They even laugh in our faces to think we take so much pains to build houses, put up machinery, and all that, when after all it does not amount to any thing comparatively—a great fuss for little or nothing.

Tempe, like the rest of Arizona, seems to be a sort of enchanted land or new world. Nothing there is as it is here at home, and few things are even like California. Right close to the town—in fact, right in the town—rises one of those abrupt rocky mountains. They call it the Butte (pronounced *bewt*), and the view from it is so striking that some one or more persons are looking off from its summit almost every hour in the day. In fact, the smoke from the city of Phœnix, the capital of the Territory, is plainly visible from the top of this butte. The meanderings of Salt River, as well as the railroad along its shores, are very plain and quite pretty. The houses, the people, the customs of Tempe, are in great part borrowed from the Mexicans and Indians that form a large part of the population. What would you think of a drygoods store, and a tolerably fine one too, for a city of two or three thousand inhabitants, that did not have a window in it anywhere? How do they display their goods? Why, they put them on the shelves as we do, and then open the wide front doors. These front doors are always open, winter and summer, in the daytime. I do not know how they manage when they have a driving rain. Perhaps they turn their customers, loafers and all, out into the street, and then lock up until the rain is over. Irrigating-ditches are everywhere, and the roads and streets are principally laid out to accommodate said ditches. There is no timber nor trees of any sort unless we call the great cacti *trees* — except along these irrigating-ditches; and these are bordered by fine growths of cottonwood. In fact, I never saw cottonwood, nor any other tree or plant, grow with such luxuriance as do these cottonwoods along the ditches. When they want to set out a belt of trees they just chop down a big cottonwood, and cut it up into poles or sticks. Sometimes the sticks are not larger than your finger, nor longer than stovewood; but just stick these into the ground, near water, and they will all grow. Artificial forests are no myth in Arizona, and there seems to be almost no failure. Cottonwoods two or three feet through may be seen along these ditches; and if one wants a shanty or stable for his stock, he sets up poles or crotches to hold the poles. If an irrigating-ditch is anywhere near the poles and crotches they will all grow. In fact, I saw them making cuttings in the month of January from pears, apples, peaches, and apricots, and from all the trees growing in the nurseries, for all I know, and all they had to do to make these cuttings grow was to stick them close up to the irrigating-ditches—so near that the water would soak through and keep them constantly wet. The climate and soil do the rest.

I visited some of the Chinese gardens, but they had nothing that pleased me as well as the garden-stuff that grows here in the East. I do not know whether it is the Chinese or the climate. I am well aware they grow fruits equal or superior to any in the world; but I doubt their being able to grow general garden-stuff equal to ours. As I was there only in the winter time, however, I may be mistaken. A good deal has been said about the wonderful skill of the Chinese in making gardens. I can not quite agree with this. The Chinese never read an agricultural paper. I do not believe they ever look at our seed catalogues, and they know nothing of new varieties. Most of their products are the result of common seed, or seed of common sorts. If a Chinese market-gardener wants some seeds he goes into a seedstore and simply says, "Led ladish." He means by this that he wants seed that will produce *red radishes*. There being no sound of *r* in their language, they use *l* in its place. If he wants to plant some peas he asks for peas; and when the seedsman asks him what kind, he holds his hand over the counter to indicate that he wants peas that grow short. If he wants tall ones he puts his hand up higher. That is all he knows about it—peas that are tall and peas that are short. He never uses any sort of improved implement—no modern cultivators—none of the hand wheel-hoes. Our good friends Posson & Son, who sell our bee-hive material at Portland, Ore., tried in vain to introduce the Planet wheel-hoes and seed-drills among the Chinese. They thought once they had got the thing started; but the Chinamen all combined together, and, through some superstitious fear, or something else, persuaded their comrade to carry back all his new-fangled tools; and, if I remember correctly, their reward for trying to do these benighted heathen a favor ended in getting their ill will; and I presume they verily believe to this day that the white man tried to do them a great and lasting injury. Now, I protest against letting this class of people drive intelligent horticulture out of any community.

Even the water in the wells of Arizona is "on the contrary." Here in the East, if we want a nice drink of water we go for the old oaken bucket, but not so in Arizona. All the water in all the wells that I found on the desert is too warm to drink. If you want it cold, and have no ice, you must let it stand in the open air until it cools off. During the nighttime and in winter it gets to be cool enough to be quite refreshing. In the summer time, however, and during the daytime in winter, they get it cool by the use of the well-known Indian ola—a jar made of porous earthenware, large enough to hold from one up to five and even ten gallons. These water-jars are suspended somewhere in the shade, but where they can catch all the breeze. They are then covered with some coarse cloth, like burlap or bagging. The porous nature of the earthenware permits enough water to slowly seep through to keep the cloth wet; and the evaporation of this water in the breeze makes the contents cool. Wherever I found an ola suspended or standing in the shade, I was always sure to get a nice drink. It took me some time to be convinced that well water there was never cold. One day when out on the desert several miles we came to a ranch where a new comer had just demonstrated that he could raise alfalfa. In order to get *drinking-water* he had dug a well through the sand and gravel, 70 feet deep. I looked down from above and saw the water shining so far below that I felt sure I had finally found a well deep enough so the water would be cool. While I was laboring to pull up a bucketful, the owner and my brother came around. They laughed at my disgust in finding water just warm enough to be fair dishwater; and then the owner took us into the house and gave us some that had cooled off. The porch in front of his house was made of some queer-looking ribs. I first thought it must be some sort of whalebone; but our host explained that they were ribs from the giant cacti. They were about as hard as whalebone, and so stiff and strong, that, although scarcely larger than your two fingers, they held up the roof of a heavy porch.

OURSELVES AND OUR NEIGHBORS.

Unto him that is able to do exceeding abundantly above all that we ask or think, according to the power that worketh in us, unto him be glory in the church by Jesus Curist throughout all ages, world without end. Amen.—EPH. 3:20, 21.

In my talk to-day I wish to call particular attention to the words, "Above all that we ask or think." In my last I did not mention the wheel and the new lease of life it has given me, at all. In fact, I feared I had said a little too much in my talk a month ago, and I thought it best to wait at least a little longer before I added any thing further. Well, about four weeks have passed since I spoke to you those earnest words; and my feeling now, in thinking about that earnest prayer, is expressed in the words I have just quoted—"Above all that we ask or think." The thought is, that, when God does see fit to answer our prayers, or, if you choose, when we have put ourselves in a line with his work and wishes, so that he can answer our prayers, the answer comes, "Above all that we ask or think." You know a great deal is said nowadays about people wearing themselves out by being overworked. Perhaps they do sometimes wear themselves out by overwork; but I am led to believe that it is not so much overwork as it is working in a single line or single channel. If I have interpreted God's answer aright, it is to the effect that we are to exercise not only all our mental powers, but all of our muscles. He intended that we should be rounded out and developed; that we should go out into the world among our "neighbors" and get acquainted with them, instead of settling down to narrow and contracted lines and limits. Since I wrote you I have been taking longer and longer rides out into the country. I have again and again exerted my strength until it seemed as if I had got to the utmost limit. In climbing hills I have had the muscles and bones and joints of my legs ache until it seemed as if I could stand it no longer. Had I not been working for several weeks right along on the line of testing and developing my muscles I should have feared the consequences. Yes, I have panted and blowed, and had my blood heated up to such an extent that I should have feared rupturing a blood-vessel, or something of that sort, had I not known from *experience* that it would not harm me at all. By the way, isn't there a mistake somewhere in this matter of overexertion that we hear so much about? In my own experience there has not been one single failure. After using my muscles and lungs and circulation in the way I have told you, and after perspiring until I was about as wet as if I had been dipped in water, I have *always* experienced this strange phenomenon which wheelmen call "second wind." It is there, and I reach it every time.

One day during this present week I rode 25 miles between seven in the morning and noon. Of course, this is no feat at all for an average wheelman; but it is to me something wonderful to think of for an invalid—or one who was an invalid—a pefect wreck, in fact, as my physician in Portland, Oregon, told me, in the way of nervous exhaustion. This ride of 25 miles was also over the hilliest and roughest roads, perhaps, in our county. Quite a part of it was climbing great hills, and then going down into great valleys, first one and then another. In coming home, some of the worst hills stood before me at just about eleven o'clock. This is the hour of my forenoon nap, as you know, and I felt strongly inclined to stop somewhere and beg the privilege of lying down. I also felt somewhat hungry from my violent exercise. In order to test the thing, however, of which I am writing, I decided to push on. In climbing great hills, for perhaps 15 minutes longer, the muscular exertion was so great that I was literally full of pain. I knew, however, from past experience, that, after reaching a certain point, this would give way, and it did. For the last half-hour, going up and down the hills was simply a pastime, and the enjoyment was some of the keenest I ever knew. Now, this is to me simply wonderful. It is like going through the unexplored regions of Mammoth Cave—yes, ever so much *more* wonderful, because it is exploring storehouses of strength in my own body—a storehouse of *latent* strength, if I may use a chemical term, which I feel astonished every time to find that God has placed there for some good and wise purpose.

Permit me to mention a queer feature of this matter of latent strength. My muscles seem to have become so accustomed to the motion and the exertion of power that they do it almost involuntarily. When I got off once to adjust something about my machine I was so stiff and sore that I could hardly walk. After getting on the wheel again, and taking up the regular motion of the treadles, no pain, inconvenience, nor stiffness was felt at all. The nerve forces seemed to have worn a channel along the line of propelling the wheel. I might almost imagine some *other* power than my own had come in as a reinforcement. Doubtless others have gone through a similar experience. But now here is another strange thing: When I got home and sat down to dinner I felt stiff and sore. After dinner it was with great difficulty that I could climb the stairs at all. I tried hard not to let my friends notice it, because they would scold; but I really could not walk without making it appear that I was crippled and used up. I imagine I can hear some of you scolding and protesting. Wait a bit. I knew by experience that this would be gone in two or three hours. About two o'clock I went over to the house and took one of my accustomed naps. When I awoke, the stiffness and soreness were all gone. I walked more easily than usual, and I was full of strength and vim. No reaction followed at all. Of course, I took pains not to catch cold. I was so thoroughly wet through by perspiration—underclothing and all—that I slept inside of a big warm overcoat. Now, this is a strange thing: but I have stranger things yet to tell you. Please look at the text again—"Above all that we ask or think." For many years I have been accustomed to drink coffee three times a day. Mrs. Root has worried a little during the past year because I kept wanting it stronger. I drink so little, however, that I have always thought it could not harm me—seldom more than a half or two-thirds of a cup. When suffering from nervous exhaustion, and feeling as if I could hardly drag one foot after another, my hand would often shake as I reached nervously for the coffee that I knew would give me steadiness and strength for the time being—that is, a feeble sort of strength. How is it now? Since I have been feeling so strong and well, my desire for coffee has, most of the time, gone entirely. I crave milk or pure water. In my most earnest prayers for health, and that it might be made known to me the secrets of health and disease, I never thought for a moment that I could be lifted to a point where I should not crave coffee, beef tea, food, or sleep. Well, for three days past I have entirely omitted my nap just before dinner. I do not need it any more than I need coffee. If it becomes necessary for me to keep on working after my accustomed meal hours, I do it without inconvenience. Isn't this really a fulfillment of the promise in the text—"Above all that we ask or think"?

Once more: Some of you may remember of my telling you that, although I have drank no beer nor ale for about twenty years, the longing for it at times is such that I would give half a dollar for a drink if I could take it with a clear conscience, and if it were not wicked to waste money in that way. Well, this intense craving for drinks slightly alcoholic came usually with nervous exhaustion. For the past month or two, since I have been riding the wheel, I have felt nothing of the kind. I have been around where beer was drank and offered for sale, and I have been surprised to feel that I had no desire for it whatever. Now, isn't there some explanation here right along in this line, for the taste or longing for stimulants? It is a perverted taste, I know; but hasn't this matter of lack of proper exercise something to do with intemperate habits? We stay indoors until we suffer, and then go to the drugstore or physician, in the vain hope that tonics may take the place of exercise, outdoor air, and sunshine.

Now, I am not through yet. There is a great deal more. But I want to digress a little here. I am talking about myself—my own feelings, and taking it for granted that every one else is like me—or, at least, taking it partially for granted. Some of the friends, or, may be, some who are not *specially* friendly, may say that I never was sick at all—I just imagined it, and, under the influence of the fashionable craze for the wheel, I simply took needful exercise. Well, you may have it that way if you like. The doctors here and on the Pacific coast, and everywhere else, said at once that I was a nervous and physical wreck; that I could never be a well and strong man again; that I would have to give up work and business. It is rather rough on the doctors, if I have *not* been sick. Let us now talk about somebody else besides A. I. Root.

Some years ago I became acquainted with a slight and in many respects delicate-looking woman. I do not think she weighed a hundred pounds. Years passed, and somebody told me that she was going about doing washing, and cleaning houses for people, because she wanted to buy a home for herself and children. Mrs. Root and I both wondered how it could be that a woman so slight could do such heavy and fatiguing work. She came to work for us—in fact, she cleaned house, and my wife and I were astonished to find that she was a young tornado for hard work. She did as much, oftentimes as *three* of *some* women. I told her not to waste her strength, for big stout men were near by, and would willingly move the heavy articles of furniture. But she did not care for the men. It took too much time to "go" for them, and they were often in the way, anyhow. After laborious house-cleaning that would use up most ordinary women, she would do a washing, and, in fact, she often did two or three ordinary washings in a day. She was determined to have a home of her own, and to have her children educated, and she has accomplished her desire, and is not worn out nor broken down either. Mrs. Root once asked her how it was possible, or by what miracle this sudden and wonderful change in her life came all at once. The answer she gave with a merry laugh was something as follows, as nearly as I can remember, for it was years ago:

"Why, Mrs. Root, I used to be one of these feeble women who are sending for the doctor, and going to the drugstore for tonics and invigorators, wearing plasters for a weak back, and not able to do their own washing. I finally made up my mind that I was going to have a place of my own where I could live, or die in the attempt. I commenced doing my own washing first; then I astonished the neighbors by proposing to wash for *them*. When all the washing was done I felt so strong and well I thought I should like to clean houses; and then I found out that my aches and pains were all gone. My back got right of itself; and the more work I have to do, the better I feel."

How much does this experience differ from my own? You may ask whether this woman had been praying. I have talked with her about it, and I think she did *sometimes*—perhaps, however, without a very large amount of faith, and I presume she does not now consider it as any direct answer to prayer. Well, the point I wish to make comes in right here. I have prayed earnestly for days and weeks that God would reveal to me his wishes in this matter of medicine and disease. Many are looking to me for advice; they regard my opinion and counsel worth *something* at least. I begged that God would give me wisdom to advise aright, and I felt as if the answer had come to me in a way that I may with safety say, in regard to this matter, "Thus saith the Lord." I do not mean by this that we should ignore physicians, and, occasionally, medicines; I simply mean to say that God gave us these bodies of ours, expecting us to keep them well and strong by using our muscles as well as our brains, and not that he intended or now wishes us to get energy and strength through tea and coffee, alcoholic tonics, quinine, or any thing of the sort. Let me give you one more illustration:

A friend of mine told me a short time ago that he had done no outdoor work in the open air for over seven years. He has worked in the factory when able; but poor health, and a complication of diseases, have kept him for all these seven years under the doctor's care, and have prevented him from working, except at intervals. Our business has been dull this past season, as you know, and there was really nothing for him to do. He remained at home, thinking himself unable to do any outside work. Finally he felt as if he could stand it no longer—that is, until he felt as if he *must* do something for a living. The only opening we had for him was in the lumber-yard, handling heavy plank. He decided to try it. In a week his color had improved, and he seemed to be fleshing up. In a month he had become tanned by the sun. His muscles had developed and rounded out, and you would hardly know he was the same man. To-day he is shoveling dirt and gets the pay of a good stout man, and, in fact, I should pronounce him to be a good stout man for almost any kind of business. He may not agree with me, and perhaps he does not himself feel that severe outdoor work has been the means of building him up; but I feel pretty sure that he has been taking no medicine at all lately. I think he found by experience in the lumber-yard, just what I have found out by my experience on the wheel. Of course, I have no right to lay down rules for all sorts of people, and apply them to all sorts of disease; but I think that, if you look about you, you can find instances just like the ones I have given. One may be worn out and used up by a certain line of work—especially work that does not take him into the open air and give full swing to all his muscles and joints.

Now, let us not be in too great haste in condemning doctors and medicine. In the hand of a skillful and intelligent physician, medicine may serve as wise a purpose as the Paris green and copper sulphate we use to banish the worms and scab from our apples. These remedies, however, are the result of careful experiment, with a definite end in view, and are not at all to be compared with commencing work on Friday or working in the right time of the moon. The world is just now struggling to have science and sense put down superstition and nonsense; and God the Father is not only willing but anxious to help us up through ignorance and superstition into the light of true wisdom: and our veteran teacher Paul was right when he used the words, "Unto him that is able to do exceeding abundantly, above all that we ask or think."

Years ago some of our agricultural journals decided they would no longer accept advertisements of any patent medicines. The *American Agriculturist*, under the administration of Orange Judd, was perhaps the first one to take this stand. "No patent medicines of any kind shall be advertised in these columns, no matter how much money may be offered," was the way they started out. Since then the *Rural New-Yorker*, *Philadelphia Farm Journal*, *The Orange Judd Farmer*, and perhaps a good many other home journals, have taken the same stand. It is a little sad to think that our agricultural periodicals were in advance of our religious and scientific journals in this line. In fact, nearly all of our religious papers seem to think it fair and right to advertise almost any thing, providing the advertisement is *paid* for. I should be glad to add that the *American Agriculturist* still holds out in that line; but only a few months ago I noticed an electrical-belt advertisement occupying the greater part of a page, displayed with great headlines; and the proprietors even offered to send one for thirty days on trial. A good many of you may ask how the proprietors of these things can be willing to send them out on trial if they possess no virtue whatever. My dear friend, people base their faith in such things exactly as they stoutly maintain that Friday is an unlucky day. They have tried it so many times they think there can not be any mistake about it, just as the farmer insists that the moon affects the weather and planting potatoes, etc. You doubtless remember how many years I have insisted that none of the thousand and one remedies for bee-stings had any effect whatever. I am sure I am right, even while I am met at every turn by neighbors who stoutly insist they have tried this, that, and the other, and they *know* it does good. If I am correct, the truth lies right here: As soon as we receive hurt or injury of any kind, nature goes to work at once to remedy the mischief; and we should remember that she usually succeeds. Most of our aches and pains, as well as our bee-stings, are gone in a little while if we just let nature alone. Now, this superstition and blundering come about because somebody takes a remedy and feels better almost immediately, just exactly as would have been the case had no remedy been administered. Many and many a time have my good friends and neighbors insisted on my taking quinine, or some other sort of bitters. Well, if I did not take it (and most of the time I didn't) I was careful to watch and see if I did not get better soon. Sometimes the trouble would disappear in a very short space of time. For instance, I would have neuralgic pains, and my friends would urge quinine, but I did not take a bit; notwithstanding, the next morning I was perfectly well. Had I taken the quinine, I myself would have been ready to declare that it was a wonderful medicine. While traveling in the cars in the South, a lady with whom we had become acquainted insisted so stoutly that Fellows' hypophosphite was just the thing to make me entirely well that she almost persuaded me to have faith. Said she, "Mr. Root, you just get a bottle, and take it; and you will write me a letter of thanks in less than two weeks. Here is my address. Now, be sure you do it, if it makes you well, as I am sure it will." Shortly after I got home one of our Medina doctors mentioned favorably the same remedy. Then another doctor prescribed it for our eldest daughter. The evidence was so strong that I purchased and took several bottles according to directions, and, in fact, I came very near writing to this good friend of mine, thanking her, as she said I would do. But I made up my mind to be very sure that I was right before I pushed ahead. I commenced taking the medicine and studying the case, exactly as our people at the experiment stations kept track of the moon and the weather. After having given the matter a very full and faithful test I became perfectly satisfied that the medicine had nothing to do *whatever* with my bad feelings or good feelings. The price is $1.50 per bottle. At the very time I was taking it I felt sure, from what I know of drugs and chemistry, that the whole expense of these $1.50 bottles was less than 25 cents. I believe patent-medicine venders admit this. They claim, however, that the expense of advertising is so great, that, in order to get a medicine fairly going, they must have these enormous profits. Now, if the advertising were square and honest, it would not be so bad; but what kind of subterfuges do you suppose they resort to? Here is an illustration, right from our own county paper. The heading that I quote comes right along in the reading-matter. The type and every thing else is exactly as local news, and right in among their local news.

WAR ECHOES.

Exciting Experience of Commander ——

One of the Most Popular G. A. R. Veterans in the Country.

A Wonderful Thing, and We Believe it to be True.

You will notice the above seems to be a heading put on by the editor, especially, where he says, "We believe it to be true." The *we* is understood to be the editor. Something remarkable has come within his observation, and he describes the whole transaction to his readers. and that strange miraculous system of cure, and he himself accepts it as true. What do you suppose the whole sensational thing is about? Why, it is a tremendous advertisement for Dr. Green's Nerve and Blood Remedy. Now, please do not think that I mean to criticise particularly the editor of the paper I happen to pick up. You take up almost any home paper in any home in the land, especially the regular county papers, and these puffs for patent medicines are so frequent one hardly knows whether or not the item he undertakes to read is going to turn out only as an advertisement. You may say this is only a joke—that everybody expects it as a matter of course. My good friend, your *nearest neighbor* accepts it as truth, and he pays more money than he can earn in a day for a bottle of this same medicine. May be he buys half a dozen bottles because he gets them cheaper; and thus it goes on until he decides, as I have done, that the medicine probably has no effect whatever. Why, it has got to be such an everyday matter that many of them put them in their papers without ever seeing them or reading them over. I think it is bad; and I do believe the editor who sells his good name and reputation to these medicine makers who have money will repent it sooner or later. In California, many palatial residences were pointed out to me as belonging to millionaires who made their money in selling the very medicines that have been before your eyes in your county paper so often that you have really become tired of seeing the same thing over and over.

GLEANINGS IN
BEE CULTURE
A JOURNAL DEVOTED to BEES AND HONEY AND HOME INTERESTS
Illustrated SEMI-MONTHLY
36 PAGES 7×10
$1.00 PER YEAR

In the sweat of thy face shalt thou eat bread.—GEN. 3: 19.

ONE of the sweetest and nicest of baby girls found her way to the home of the *Bee-keepers' Review*. GLEANINGS offers congratulations.

BEWARE of the Rambler when he pulls out his camera. We show him in another column, so that you may be on the lookout if he should by chance come *your* way.

IT is getting time now for prices on honey to be stiffening up a little. Better figures are usually secured from now on until the holidays than before or later. Watch your chances.

HILDRETH BROS. & SEGELKEN, in the Honey Column, say that the California honey crop is not a failure, as first reported, and that, since July 8, they have purchased twelve carloads of California extracted honey. Good! While it may not have been a failure, yet the crop was very much shorter than usual.

THE following from Prof. Cook, in regard to honey-dew and its analysis, will explain itself:

> Will you ask bee-keepers, through GLEANINGS, to send me samples of honey from honey-dew? I wish all kinds good, bad, and indifferent; from acorns or oak; Missouri and Arkansas, and from plant and bark lice. Will all who have samples express to me three or four pounds at my expense? I don't care when it was collected. I need it for the investigation which we are carrying on.
>
> A. J. COOK.
>
> Agricultural College, Mich., Sept. 17.

WE have just been trying the new Crane hot-blast smoker, as recently illustrated in the *Bee-keepers' Review*. From some tests we have made we are of the opinion that it is superior to any other smoker ever constructed. It has the force of the cold-blast and the volume of the hot-blast very nicely combined. Mr. Crane authorizes us to say that the smoker will not be offered for sale until it has been thoroughly tested by a few competent bee-keepers, and its value fully determined.

THERE seems to be a smaller crop of honey this year than usual—at least, there is not very much offered. We notice from the reports, that consignments are small. Does this mean that the honey crop this season was actually smaller this year, even, than last? By the way, the fall honey crop, judging by the letters we are receiving every day, is unusually large. At our basswood apiary we actually had to give the bees more room because they had crammed almost every available cell with honey and brood. Goldenrod has been out in great profusion, and this is, no doubt, the source whence the honey comes.

NEAT and novel display is one of the important requisites in advertising; and to help our patrons we are always glad to offer suggestions or to submit proofs of advertisements, free of charge. As a general thing, if our customers will allow us to use our own judgment as to display, not cramping us too much in space, we can suit them better than to try to carry out a certain style that they may have in mind. We have a good many advertisers who have been with us for years; and if there are any of these who would like to see a proof of their advertisement reset according to our own ideas of display, we will send it free of charge. An advertisement ought to be changed occasionally, else it becomes worn out and people do not see it.

NEXT to the North American, the Illinois State Bee-keepers' Association, formerly the old Northwestern, is the most important, probably, of any bee-keepers' association in the United States. Since it receives annually an appropriation of $500 from the State government, it is in a position to do effective and important work for the bee-keepers of Illinois. The next meeting promises to be an interesting one, and certainly all bee-keepers of the State, besides those near in Wisconsin and Michigan, should make an effort to attend. The following is an announcement from the secretary:

> The Illinois State Bee-keepers' Association will meet at the Commercial Hotel, Chicago, on Tuesday and Wednesday, Oct. 18th and 19th, 1892. This being the week of the dedication of the World's Fair Buildings, we may expect reduced railroad fare, and consequently a large attendance.

THOSE HOFFMAN FRAMES AND PROPOLIS.

THOSE who have been using the Hoffman frames have doubtless noticed that propolis seems a little worse just before cool weather than at any other time. In pulling apart the frames, the bee-glue acts rather waxy. Some observing this might feel, perhaps, this was only the beginning of troubles; but for their encouragement we may say that new propolis is more sticky or gummy than old. When it becomes a little older it will be less tenacious, and give less trouble in separating the frames. We know, for we have been trying the experiment. If one desires to enjoy immunity from propolis, let him rub the contact edges with grease. But even with the propolis we can not see that the Hoffman frames on the new tin rabbets separate with any more difficulty than the old-fashioned open end or loose frames on wood bearings. Either must be pried up with a screwdriver or knifeblade. Bee-keepers have long since decided that they want their frames sufficiently fast to require prying, so that the colonies may be handled without jarring the frames all together in a heap. If a frame must be pried, why not have it self-spacing?

GREENHOUSES AND GREENHOUSE WORK.

The Ohio Experiment Station, in its Bulletin 43, has given us some of the most valuable information in regard to vegetable-growing in greenhouses, that we ever met anywhere. The different subjects treated are, "Fertilizers in the Greenhouse;" "Sub-irrigation in Greenhouses;" "The Water-bench;" "Crops Suitable for Forcing;" "Calendar of Operations;" "Tomatoes as a Greenhouse Crop;" "Lettuce as a Greenhouse Crop." Chemical fertilizers so far have given no good results whatever. Their experiments with nitrate of soda are just like ours. Whether used in large, small, or medium quantities it is of no benefit whatever to the crop. This Bulletin 43 is sent free to all residents of the State who request it. I do not know on what terms it will be sent out of the State; but every one who is working at all with greenhouses or with sash should have this bulletin.

SECOND WIND—MORE ABOUT IT.

Don't forget to read the text at the head of this deparment, even though it is short and in small print. It has occurred to me of late, that, although the text is a part of the curse pronounced upon Adam and Eve, yet there is a wonderful blessing in it after all. Some of the friends may think that exercise for fifteen or twenty minutes will be enough for half a day in school, or in the office at the desk. But this is a mistake. You must labor out in the open air, and until the sweat drops from your face, or you can not eat bread, nor enjoy life either, as God intended you should enjoy it. Sometimes of late, when hurried with business I have thought that a ride on the wheel for a couple of miles ought to answer; but it does not bring the real blessing at all. It takes at least four or five in my case to bring that delicious second wind, and sometimes it takes ten miles. Did you ever wish you could have back again the keen relish for food that you remember of having in your childhood? Well, you persevere until you reach the second wind, and you will have it. Your bread and butter will be more delicious than any thing you have tasted before, perhaps, in forty years; and a drink of spring water gives you such satisfaction that you must be dull and undemonstrative if you do not break out into exclamations of delight. Every thing that is put on the table is so refreshing and satisfying, that, if you never thought of giving thanks to God before eating your meal, you will think of it now and feel as if it were the thing to do. Don't be discouraged, and give up because you tried once, and this thing I have described did not come to pass. Keep out in the open air; keep testing your breath and muscles; and when the sweat drops from the end of your nose, and runs into your eyes until you can scarcely see, then you will begin to see something in the little text I have quoted, and may be you will think as I do, that, if there is any class that do not know what it is to eat their bread by the sweat of their face, these are the ones to be pitied. May the Lord be praised for this wonderful—not curse, but privilege.

The sweat of the face not only gives physical strength, but spiritual as well. We copy the following from "Hints to Lady Cyclers," from the pen of Rev. F. W. Rider, Pastor of the Central Baptist Church, Boston:

> The bicycle is a great "means of grace." I get up sometimes of a Monday morning, nervous, headachey, and hardly willing to see my best friends. A ten-mile spin on my wheel brings me home in a state of perspiration and bliss; and, after a vigorous rub down in the bath room, I am quite prepared to love my enemies and pray for them that despitefully use me.

KIND WORDS FROM OUR CUSTOMERS.

I shall have to buy considerable honey from some one this year and I must say that I have had more satisfaction in buying it from you than any other dealer I have met with yet. M. H. Tweed.

Pittsburg, Pa., Sept. 6.

I have taken Gleanings for six months, and it has so endeared itself to me that I feel I can't do without it. Inclosed find $1.00 for one year's subscription. The A B C is worth $5.00. I don't see how I could have done without it.

Odin, Mo., Sept. 9. D. B. Thomas.

I have borrowed from a neighbor your book, "What to Do," etc., and it contains so many valuable hints that I want a copy for myself. I am especially pleased with the Christian tone of your book. It does me good. F. A. Hubbard.

Carthage, Mo., Aug. 22.

MORE THAN PLEASED WITH THE COWAN EXTRACTOR.

Cowan extractor received in good shape. I am more than pleased with its execution. I send herewith supplementary order. Forward at once.

Imlay City, Mich., Sept. 2. Wm. Anderson.

THE BINGHAM SMOKER AND THE COGGSHALL BEE-BRUSH.

The goods have come through all O. K. Every thing was in good shape, and I am a happy bee-man thinking of flowers so gay, and hoping that those snow-white sections will be filled with honey. I can't speak too highly of the goods. The Coggshall bee-brush and Bingham smoker are essential accessories to every bee-keeper. J. H. Goe.

Mossy Rock, Wash., Aug. 25.

DR. MILLER AND THE RAMBLER.

Gleanings always comes bright and sweet, full of fresh straws with golden grains from Dr. Miller. Mr. Root, I admire the "Rambles" and "Notes of Travel" very much; but they give me the California fever, and I guess it won't stop till I have been there. Tell the Rambler to kill that skunk that lives under his wax-extractor, before I come to California; but let some of those cotton-tailed rabbits remain alive till I come out there and show him how to cook them. Wm. B. Gehrels.

Biegel, Texas, Aug. 30.

THE BOOK "WHAT TO DO," ETC.

Friend Root: You will pardon me, I hope, if I seem to use a familiarity accorded only to old friends. The truth is, that your book, "What to Do," etc., has been so faithfully read, used, and quoted from since we and our little farm took possession of each other, we feel quite well acquainted with you; and when I earnestly endeavor to thank you for enabling me to put into the hands of my boys a book so practically helpful and so simply and reverently loyal to the great Father of us all, please do not think it the mere customary congratulations. Only eternity can reveal the good you have done. Meantime it will not harm you to know that your book is used and loved. My boys of ten and twelve, in their gardening operations, want to know continually "what Mr. Root says," and they read your book as eagerly as a story. What a blessed occupation tilling the soil is for growing boys! Mine just love it, and I can not be thankful enough that they do. Mrs. M. Slusser.

Downers Grove, Ill., Aug. 15.

5 Per Cent Discount On All Goods

Listed from pages 10 to 30 of our price list, which are ordered between now and Dec. 1st. for next season's use. This does not apply to goods on other pages, except those mentioned. **A special reduction of 20 cents on each two-story chaff hive,** ordered for a limited time. The quantity and early-order discounts to apply also. Special prices quoted on sections in lots of 2000 and upward. Name the quantity and size when you write. We guarantee as good a quality for the price as you can obtain anywhere. Dealers should not fail to write us before making contracts for another season's supply. We offer special inducements.

A. I. ROOT, Medina, Ohio.

Please mention this paper.

Barnes' Foot-Power Machinery.

Read what J. I. PARENT, of CHARLTON, N. Y., says—"We cut with one of your Combined Machines last winter 50 chaff hives with 7-inch cap, 100 honey-racks, 500 broad frames, 2,000 honey-boxes, and a great deal of other work. This winter we have doubled the amount of bee-hives, etc., to make, and we expect to do it all with this saw. It will do all you say it will." Catalogue and Price List free. Address W. F. & JOHN BARNES, 545 Ruby St., Rockford, Ill.

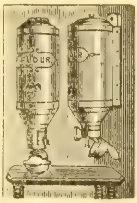
When more convenient, orders for Barnes' Foot-Power Machinery may be sent to me. A. I. ROOT. 23tfd

SPECIAL NOTICES.

HONEY MARKET.

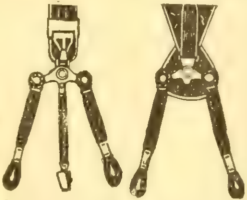
We have been having a brisk demand for honey, especially comb. We are not able to keep much of this on hand, as orders reach us about as fast as the honey shipments. We should be pleased to correspond with those who have not sold yet. We have paid the producer net, so far, from 15 to 16 cts. for choice white, delivered here. We have been selling at 17 to 18. Good extracted honey is in demand, and we have a light supply.

TYLER FLOUR-RECEPTACLE.



We still have some of these very useful household articles on hand, which we can furnish at $2.50 each for the size holding 50 lbs. of flour, or $2.00 for the 25-lb. size. A crate of 6 of the 50-lb. size for $12.00. We use these receptacles in our homes, and find them very handy. The cut shows how they are used. We hang them on the pantry wall, right over one end of the shelf, just high enough to allow a pan to be placed under to catch the flour as you turn the sifter crank. You thus get the flour as you want it, already sifted, and without getting it on your sleeve, as is often the case when you dip it from a barrel or bin.

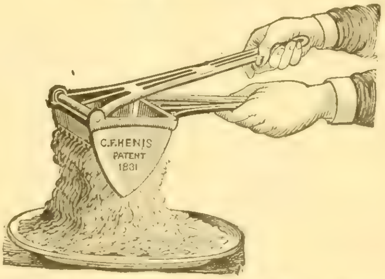
FOSTER SUSPENDERS.



The Foster is one of the best suspenders made, and wear very easy on the shoulders. These, as the cut shows, have eveners to make the strain alike on each button. They are good web, all white or light drab, and nickel trimmed, with drawer lift. The ends button on to the evener the same as to the pants button.

Mr. H. E. Felger, of Geneseo, Ill., after ordering two pair, adds, "I think this is my fourth or fifth order for these suspenders, and I certainly think they are the best in the market." We have them only in white and light drab, with cotton ends. Price 35c; with silk ends, 50c. Postage extra, 5c a pair.

HENIS' FRUIT-PRESS.



These are a very handy and useful instrument, not only for mashing potatoes, as shown in the cut, but especially for making fruit jams and jells. It is a press and strainer combined. It is likewise an excellent thing for pressing wax out of old combs when you melt them up. We have sold a great many of these in the past, but the manufacturers advanced the price, and they have not been selling so rapidly since. We laid in a good stock when the price was advancing, and the prices we have been offering are as low as the wholesale prices made by the manufacturer. To make them move off, now that they should be in demand, we offer the following prices: 30 cts. each. By mail, 50 cts.; 1 doz., by freight or express, $3.00; or a box of 3 doz. for $8.25.

EXTRA EARLY AMERICAN PEARL ONION-SETS.

We have just succeeded in obtaining another barrel, and expect to be able to fill orders promptly. For prices, see our last issue.

COTTON CLOTH FOR COLD FRAMES.

Just common white unbleached cotton cloth, such as you get at your nearest drygoods store, is all that is needed. It should be rather stout and heavy, however, (the kind known as 8 oz.) especially if you want to cover your cold-frames with straw or leaves, as directed on page 9 of the tomato book The kind we use is Utica sheeting, nine-fourths wide (78 in., to be exact), and it is worth just now in the market about 25c per yard for a full piece of about 40 yards. If you do not find it near your home to suit you, we can furnish it at the above figure.

A NEW BOOK ON TOMATO CULTURE, PLANT GROWING, AND HIGH-PRESSURE GARDENING IN GENERAL.

The tomato-book is finally all complete, ready to mail to applicants. Price 35c; by mail, postpaid, 40. To get your tomatoes started, more or less gardening under glass must be done, as you are probably well aware. Well, when you can manage the tomato under glass, you are ready to manage almost any other vegetable crop; therefore we regard the tomato book as one of the most valuable if not *the* most valuable of any work on raising plants and vegetables that require protection from the frost; and whether the protection is to be in the fall of the year, or the middle of the winter, or in the spring months, you will find the tomato book full of the latest and most modern appliances for giving protection at the smallest expense. Of course, a part of it has already appeared in GLEANINGS; but probably considerably more than half will be found new to our readers.

PLANTING TO BE DONE IN OCTOBER.

Asparagus-roots, Henderson's Palmetto, two years old last spring, 10 for 10c; 75c per 100; $6 00 per 1000. If wanted by mail you will need to add 2c extra per root, they are so strong and heavy. Winter, or Egyptian onion-sets; for prices, see last issue. Rhubarb, or pie-plant, either Victoria or Linnæus; strong plants, from 10 to 25c; but these are so heavy they will have to be sent by express or freight. "Little fellers," from seed sown last spring, 5c each; 35c for 10, or $2.00 per 100. These can be sent by mail for 3c each additional. Horseradish-roots, 10c for 25; 25c per 100, or $2.00 per 1000. If wanted by mail, add 5c for 10, or 25c per 100; also strawberry-plants to those who have tried October planting and know they can make a success of it. For prices, see page 632, Aug. 15. October is a good month for putting out basswood-trees. For prices, see our catalogue, mailed on application. At present, however, we have only one size in our nursery—from one to five feet.

JENNIE ATCHLEY'S HOME
will be at Beeville, Bee County, Tex., in 1893, ready with queens again. 19tfdb

Black and Hybrid Queens For Sale.

For the benefit of friends who have black or hybrid queens which they wish to dispose of, we will insert notices free of charge, as below. We do this because there is hardly value enough in these queens to pay for buying them up and keeping them in stock; and yet it is oftentimes quite an accommodation to those who can not afford higher-priced ones.

I have some hybrid queens of this year's raising for sale, at 25 cts. each. 18-19d
J. H. JOHNSON, Middaghs, Northam'n Co., Pa.

I have 5 mismated Italian queens, some producing 2 and 3 bands, and some young ones just beginning to lay, that I will sell for 30c each, or 4 for $1.00. Some of these may produce pure bees.
M. H. DEWITT, Sang Run, Garrett Co., Md.

S. T. FISH & CO.,

Commission Merchants.

Green, Dried, and Evaporated Fruits, Honey, Butter, Cheese, Eggs, Potatoes, Poultry, and Grain.

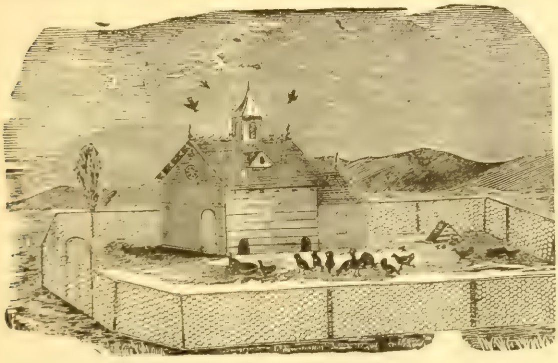
189 South Water St., Chicago, Ill.

We make a specialty of our **HONEY DEPARTMENT**, and sell our receipts throughout the United States. We have export connections whom we supply when prices reach such point as to permit foreign markets placing orders with us. We are opposed to adulteration in any form, and will positively not sell anything but pure honey. Send your adulterated honey elsewhere, but your pure honey **WE WANT**. We make liberal advances on consignments, and accept goods on a limit. **What Have You to Fear** by entrusting goods to our care? Nothing. We are responsible, and refer you to any bank or to GLEANINGS. To those who wish to sell at home we beg to advise we are buyers. We ask your correspondence, which will receive immediate response.

Respectfully, S. T. FISH & Co.

Cut this out and place in your honey house. Mention GLEANINGS.

Galvanized-Wire Poultry-Netting and Fencing.
The Best Made at the Lowest Price.



We handle only the G. & B. brand, which we consider the best made, as it is made of wire fully up to gauge, and has three-strand twisted-wire selvage, while other makes have only two. We have secured a carload from the factory, at a special low price, which we are able to sell lower than you can buy it anywhere else of equal quality, and lower than we have ever sold it before, though we have been getting more for it the past two years than we did in 1890. This carload that we have purchased is all 2-inch No. 19 netting, the size generally used for poultry. It was made nearly a year ago, and has lost some of the bright luster of fresh new goods; and it was for this reason alone that we bought it lower and are able to sell it cheaper. It is guaranteed equal in every respect to fresh new goods of the best quality, except in luster, which practically is of no account, because the brightest netting becomes dull in a few weeks after being put up. We have in stock all widths from 12 inches up to 60, which we can furnish at the following prices. All shipments must be made from here. We can not ship from New York or Chicago at these prices; but as we are able to secure through rates to almost all points from here, the freight will be little if any more than if shipped from either city. ¾-inch staples for below, 20c per lb.; 5 lbs. or over, 16c per lb.

Rolls 150 ft. long.	1 roll.	5 rolls.	10 rolls.	Rolls 150 ft. long.	1 roll.	5 rolls.	10 rolls.
2-in. No. 19, 12 inches wide,	$1 00	$ 4 50	$ 8 75	2-in. No. 19, 36 inches wide,	$2 90	$13 50	$26 00
" " 18 "	1 50	5 75	12 00	" " 42 "	3 40	16 00	31 00
" " 24 "	2 00	9 00	17 50	" " 48 "	3 75	17 50	34 00
" " 30 "	2 50	12 00	23 00	" " 60 "	4 75	23 00	44 00

The lot includes over 600 rolls, most of which are 48 inches wide, the usual size used. This price will last only as long as the stock lasts. You will do well, therefore to order early. The above prices are less than the wholesale quotations to-day on netting not one whit better, if as good. If you want other sizes, or shipment from New York or Chicago, write for our special 20-page netting catalogue, mailed on application.

CONVENTION NOTICES.

The Illinois State Bee-keepers' Association will hold a two-days session in Chicago, at the Commercial Hotel, Tuesday and Wednesday, Oct. 18 and 19, the week of the opening of the World's Fair. As the railroads will give cheap rates at that time, and there being business of importance to bee-keepers to come before the meeting, relating to the appropriation for a display at said fair, a large attendance is expected. Let all come well prepared to ask and answer questions, and have a good time.

J. A. STONE, Sec.

Bradfordton, Ill., Oct. 6.

The Southwestern Wisconsin Bee-keepers' Association will hold its next annual meeting in Boscobel, Grant Co., Wis., on the 13th and 14th of January, 1893, commencing at 10 A.M. All members of the association are requested to be present, as the following officers are to be elected: President, vice-president, secretary, assistant secretary, and treasurer. Blank reports will be sent to each member of the association for 1892, with instructions. A cordial invitation is extended to all bee-keepers, and especially to those who would like to join us. Each member will be notified at least one month before said meeting.

BENJ. E. RICE, Sec.

Boscobel, Wis.

The 13th annual convention of the Northeastern Ohio, Northern Pennsylvania, and Western New York Bee-keepers' Association will convene in the parlors of the Eureka Mineral Springs Hotel, Sægertown, Pa., Oct. 19th, 1892, at 10 A.M., for a two-days' session. The program will consist of practical topics relating to apiculture, discussed by practical bee-keepers. Sægertown is situated six miles east of Meadville, on the New York, Pennsylvania & Ohio Railroad. Reduced rates have been secured to those attending the convention. Sægertown is situated on the banks of a beautiful stream of water, and is one of the finest summer resorts in the country. A steamer is afloat on the river, and will be at the disposal of all wishing it. It is hoped that there will be a large attendance. Ladies are especially invited. Programs will be sent to members, and to others who request it of the secretary.

M. E. MASON, President,
Andover, O.

G. SPITLER, Secretary,
Mosiertown, Crawford Co., Pa.

HONEY COLUMN.

CITY MARKETS.

CINCINNATI.—*Honey.*—Demand is good for all kinds of extracted honey at 5½@8c on arrival, according to quality. Arrivals are not equal to the demand. We don't dare to solicit new trade. Comb honey is scarce. A good business could be done at 15@16c for best white if stock were on hand. There is a fair demand for beeswax at 23@25c for good to choice yellow on arrival. Supply is good.

CHAS. F. MUTH & SON,
Oct. 11. Cincinnati, O.

BUFFALO.—*Honey.*—Our market continues steady and firm at mostly 15@16 for fancy 1-lb. comb; No. 2, 12@14; No. 3 clover, etc., 8@10. We have a much lighter supply than usual for our winter trade, and need several tons yet. Should be much pleased to hear from all those adjacent to this market, assuring them the best possible results obtainable anywhere. Will advance ⅔ value and more on all grades. Extracted honey for this market should be mostly in 10-oz. tumblers, 12 or 18 in a crate, ranging $1.25 to $1.50.

BATTERSON & CO.,
Oct. 8. 167, 169 Scott St., Buffalo, N. Y.

ALBANY.—*Honey.*—Demand good for honey now, and receipts lighter than will be later. We think early sales the best. We quite: White comb, 15@16; mixed, 13@14; buckwheat, 12@13. Large and imperfect combs and double glassed, etc., sell for less. Extracted, white, 8@8½; mixed, 7½@8; dark, 6@7. Especial good demand for extracted this season. *Beeswax*, 27@28. If you wish, will advance you ¾ market on receipt of any honey, and sell promptly and remit balance. Write us if you want some shipping-pasters with a number indexed to you on our books. It is a neat way to ship.

H. R. WRIGHT,
Oct. 3. 326, 328, 330 Broadway, Albany, N. Y.

NEW YORK.—*Honey.*—Demand for honey increasing. Market firm; quote as follows: Fancy, 1 lb., 17; 2 lb., 13. Fair, 1 lb., 12@15: 2 lb., 11@12. Buckwheat, 1 lb., 10@11; 2 lb., 9@10. Extracted, clover, 8@8¼; buckwheat, 6. *Beeswax*, 25@27.

Oct. 10. CHAS. ISRAEL & BROS.,
110 Hudson St., New York.

ST. LOUIS.—*Honey.*—Choice white-clover honey in 1-lb. sections, 16@18; fair, 13@15; buckwheat, broken, and dark, 7@10. Extracted, in bbls., dark, 5¼@5½; light, 5¾@6¼; in cans, choice white, 8@9; fair, 6½@7½. *Beeswax*, prime, 24½.

Oct. 10. W. B. WESTCOTT & CO.,
St. Louis, Mo.

BOSTON.—*Honey.*—Market very strong for comb honey. Best white 1-lb. comb selling at 18@19; no 2-lb. on hand. Extracted white, 8@9. No beeswax on hand.

BLAKE & RIPLEY,
Oct. 10. Boston, Mass.

KANSAS CITY.—*Honey.*—The supply of comb and extracted is light; demand good. We quote No. 1 white 1-lb. comb, 16@17; No. 2, 1 lb., 14@15. No. 1 amber, 1 lb., 15@16; No. 2, 10@12. Extracted, white, 7@7½; amber, 5@6. *Beeswax*, 20@21.

Oct. 10. CLEMONS-MASON COM. CO.,
Kansas City, Mo.

DETROIT.—*Honey.*—Best white comb honey in fair demand at 14@15; dark or amber, 12@13. Extracted, 7@8. *Beeswax* dull at 24@25.

M. H. HUNT,
Oct. 10. Bell Branch, Mich.

KANSAS CITY.—*Honey.*—There is a good demand for honey, but a very light supply. Price of 1 lb. comb, white, 17c. Extracted, 6@7½. *Beeswax*, 22@25.

HAMBLIN & BEARSS,
Oct. 10. 514 Walnut St., Kansas City, Mo.

CHICAGO.—*Honey.*—Fancy white comb honey selling at 17@18c; second grade, 15@16. We guarantee to sell no extracted honey less than 7c, and from that to 8½. *Beeswax*, 26. All the above scarce on our market, and in good demand. We advise prompt shipments.

S. T. FISH & CO.,
Oct. 10. 189 So. Water St., Chicago, Ill.

ALBANY.—*Honey.*—Receipts are quite large, both of comb and extracted, but it is principally dark honey. White clover seems to be scarce, and commands a good price. We quote fancy white 1-lb. sections, 17@18c; good, 14@15; mixed, 12@13; buckwheat, 10@12; 2-lb sections sell at a cent a pound less. Extracted, 6@8c. We have made one sale of prime beeswax at 30c per lb.

CHAS. MCCULLOCH & CO.,
Oct. 12. 393, 395, 397 Broadway, Albany, N. Y.

CHICAGO.—*Honey.*—The honey market is firm, and we get 17@18c for best lots of white comb. Extracted brings 6@9c per lb., according to quality and kind. *Beeswax*, 22@26.

R. A. BURNETT,
Oct. 8. 161 So. Water St., Chicago, Ill

ST. LOUIS.—*Honey.*—Demand for extracted continues good, at 5¼@5⅝. Demand for comb quiet. We quote 10@16. *Beeswax*, prime, 24½.

Oct. 1. D. G. TUTT GRO. CO.,

Winter Losses

Are not always the result of the same cause. They may come from starvation; from poor food; from improper preparations; from imperfect protection, or from a cold, wet, or possibly a poorly ventilated cellar, etc., etc. Successful wintering results from a proper combination of different conditions. For clear, concise, comprehensive conclusions upon these all-important points, consult "ADVANCED BEE CULTURE." Five of its thirty-two chapters treat as many different phases of the wintering problem. Price of the book 50 cts.; the REVIEW one year and the book for $1.25. Stamps taken, either U. S. or Canadian. New subscribers to the REVIEW for 1893 receive the balance of this year free. **W. Z. HUTCHINSON, Flint, Mich.**

Best on Earth.

More than one hundred thousand Bingham & Hetherington Honey-knives and Bee-smokers in daily use. Illustrations sent free.

Bingham & Hetherington,
Abronia, Mich. 7tfdb

PRICE $2.
(POSTPAID).

Ladies' Fine Shoes, Genuine Kid, Soft Soles; Style, Fit, and Wear Equal to $3 Shoes. High or Low Heel; Broad or Narrow Toe; Sizes 1 to 7. C D E or E E Widths. Send your size. Sure Fit. Patent tips, same price.

Vol. XX. OCT. 15, 1892. No. 20.

STRAY STRAWS

FROM DR. C. C. MILLER.

Prices of honey are slowly climbing.

First frost on my place, Oct. 5. Long season.

The crop of new bee-journals this year was not unusually large.

Honey-flow didn't wait for frost, but stopped some days before.

Feeding for winter. Doolittle says in *Review*, should not be done too rapidly; five pounds a day is better than faster.

In improving a strain of bees, Hasty, in *Review*, thinks it important to encourage those colonies which start very few queen-cells.

Are you sure, dead sure, that your bees have stores enough for winter? May be you'd better give them a little more. They'll not waste it.

Bicycles ought to come down in price, ought they not? You see, it doesn't cost them any thing for advertising. All the riders advertise them gratis.

Laying workers, in a few cases that I have noticed, ceased laying when given a sealed queen-cell, before the queen hatched out. Is that the general rule?

Geo. F. Robbins doesn't like my way of preventing increase (p. 725). Neither do I. But I like his still less, for it would make me have additional help to watch for swarms.

Uniting colonies or driving away robbers, J. F. Shirk says in *Review*, he does by using a a spray of carbolic acid—one dram of acid to seven of water, with half a dram of glycerine.

Heather honey is a standard article across the ocean, but it seems the plant will not grow this side. The honey is fine, but has the peculiarity that it can not be extracted—too thick.

The *Medical News* says the records of Yale College during the past eight years show that the non-smokers are 20 per cent taller than the smokers, 25 per cent heavier, and had 66 per cent more lung capacity.

Bee-escapes are in high favor in England, where they are very appropriately called *super-clearers*. The *British Bee Journal* favors simple cones, letting the bees escape outwardly, for early work; but as soon as honey *begins* to fail, then the Porter.

"Once a robber always a robber" is one of the teachings about bees that has passed current because no one contradicted it. I venture to say, with some fear and trembling, that there is very little truth in it. To-day, with no honey yielding, you see robbers trying every crack and crevice; and to-morrow, with a good flow, not a robber is to be seen. What has become of them, if they are robbers for life?

Wax-worms, when first hatched out, are killed by a very little sulphur; but when they become hoary in wickedness they need to soak for hours in a thick smoke before they will succumb. They are somewhat, in this respect, like weeds and bad habits.

G. M. Doolittle abuses me in *Review*. True, he doesn't call me by name, but then he talks about bee-keepers that get on a craze over a new thing and try it on the whole apiary instead of first trying the experiment on a few colonies. I knew whom he meant just as soon as I read it.

Drone brood, well advanced, is recommended as fish-bait, particularly for trout, by Herr Tirpitz, in *Deutschen Bienenfreund*. Can't we get up a market for our drone brood, selling to anglers for so much a pound, or shall we sell them all our colonies that have drone-laying queens or laying workers?

Hutchinson has another little girl to help work on the *Review* when she grows big enough. The twins are Nora and Cora, and now he might call the new one Dora. Then when he grows rich through the *Review*, and retires to his country estate, he can go out in the woods and call one of the girls and the whole three will flock around him.

October has come,
And the bees' busy hum
Is kind o' dyin' away.

The hope of a crop
Must surely now stop,
But we can begin gettin' in talk about the bright prospects for another year.

Anent laying workers, H. Fitz Hart says he found two in a hive with a laying queen only a few months old. He thinks laying workers often the cause of queenlessness, rather than queenlessness the cause of laying workers. Possibly; but in that case I should hardly expect that giving brood or queen-cells would lead to the removal of the pests.

A robbers' exchange is Hasty's last conceit, in *Review*. "An empty hive with a very small entrance, in which a little waste honey is put from time to time. Then if any mischief is going on anywhere it will be made known to you by the crowd of would-be robbers bobbing around the exchange; but if the exchange is quiet you may feel comfortably assured that honesty prevails throughout the yard."

Prevention of after-swarms. A very simple way is given by Hedrich, in *Bienen-Vater*. Place in front of the somewhat enlarged entrance of the hive a box (a cigar-box for 250 cigars is suitable), having an entrance one-fourth as large as the hive-entrance, a suitable alighting-place at this entrance with a little board to shade it. The first swarm goes through all right, but all after-swarms stop in the little box, make a big row there, and then return to the hive.

To SEPARATE SWARMS that cluster together, H. L. Jeffreys gives this plan in *American Bee-keeper:* Set two boards up edgewise, far enough apart to hang frames between, making a sort of temporary bee-hive. Hang between the boards about ten frames for each swarm in the cluster, having every fifth frame contain an empty comb; shake the bees on the frames; cover with a cloth; leave them thus for three or four hours, when each swarm will be separated with its own queen, and can be put in its own hive.

HONEY ADULTERATION.

THE COMMISSION MAN VERSUS THE HONEY-PRODUCER; SOMETHING FROM A COMMISSION MAN.

I read Prof. Cook's article on honey adulteration, page 688, twice and thoroughly. I may be mistaken; but if I read it right, I come to this conclusion: Bee-keepers have an enormous advantage over the honey-dealers, to say nothing of the packers or mixers. The new law, which went into effect on Sept. 1, 1892, reads as follows: "Whoever shall adulterate maple sugar or honey with glucose, cane sugar or syrup, beet sugar or syrup, or any other substance for the purpose of sale, or offer for sale maple sugar, maple syrup or honey *that has been adulterated in any way*," etc. Would not the man who fed his bees on sugar syrup be equally guilty (if not more so) than the man who mixed honey with cane syrup? And yet it could not be proven against the former, for I believe no chemist will make an affidavit to positive detection of same in the former. But in the latter he can, according to Prof. Cook; and should a man suffer penalty of the law because he added sugar or glucose, to protect the former, who adulterates the bees, to prevent the discovery of his own deception? And if you did, would you be doing the public, the dealer, or the bee-keeper good? It strikes me there is a loophole for the latter, only the public and the dealer must suffer just the same.

Prof. Cook also states, in his results, that the best glucose costs about 2 cts. per lb. The price of the cheapest is more than that. The price of the cheapest on Saturday was 2.37, carload lots. The best glucose is worth 5 cts. per lb.; the price of granulated sugar is 5.18; cane syrup is 24 cts. per gallon, which is cheaper than glucose, as it is .02$\frac{2}{11}$ per lb. You will also see here that it is a question whether that new law will hold good.

But the best I have seen is an article, also in GLEANINGS of Sept. 15, page 690, by Mr. W. J. Cullinan, of Quincy, Ill. But then you would have to get a standard, and then there would be more grades of honey, which would be better for dealers, and the price would be according to grade. It would be stamped, which would hold the dealer safe. As it is now, a bee-keeper can mix honey, ship to a dealer who sells on commission, gets his money, makes his returns, and then the retailer is gobbled up, fined, or sent to jail, providing the dealer is out of the State. If the dealer is in the State, he must stand the consequence. He, in turn, must look to the bee-keeper. If he is not in the State, he can not hold him. If he is in the State, and the dealer is fined $500, he looks for the bee-keeper, finds him at a cost of another $100, and then discovers that the bee-keeper is not worth a cent. The dealer loses $500 fine, $100 in looking for his man, pays cost of court and lawyer's fees, which will be making it light at $200, or a total of $800; then it may cost half that much to have the supposed bee-keeper sent to jail, which is an awful lot of satisfaction that a dealer gets at a cost of $1200; and I for one do not believe that there are not some bee-keepers who are not above mixing honey; at least, from my information out of the *American Analyst* of June 18, 1892, pages 209-211, there are some of the most reliable dealers in the country quoted as selling adulterated honey, ourselves not excepted; and a large concern for whom I believe GLEANINGS has a very high regard for its honest dealing and good reputation for the honey market, also state they trust to the honesty of their shippers. Truly it strikes me as being a sad state of affairs—a bee-keeper having the right to feed his bees on what he likes, and no one to interfere with him, as there can be no direct proof brought against him. We have had comb honey from Virginia, also from New York State, which was very pretty, but tasted just like so much sugar-water; but we sold it for what it was, and sold it cheap; and yet the shippers, I believe, were not satisfied with what we got, although for our own use we would not have given nearly as much as we got, for it was only the looks that sold it.

We are willing to keep the ball rolling, and help along the sale and the enforcement of selling pure honey; but it strikes me that there will have to be some other plan than the one pursued so far. CHAS. ISRAEL.

New York, Sept. 30.

[As we stand in the relation of honey-buyer and honey-producer, as well as one who, from the editor's standpoint, sees more intimately both sides, we may be in a position, possibly, to give some facts without prejudice or bias. That bee-keepers may adulterate honey before it comes from the hives, as made by the bees, is possible. We have known it to be true in only one case, but in that "the other fellow squealed," and the bee-keeper himself was cautioned against a continuance of the practice under pain of receiving a little unenviable notoriety. Yes, it is *possible* that the producer may adulterate, but it is very improbable. Adulteration is in itself so iniquitous, hateful, and injurious to every interest of the bee-keeper that it is the very last thing he would do. He feels so outraged, that, if he could get hold of the dishonest city adulterator, he would prosecute him to the fullest extent of the law. Bee-keepers as a class would no more adulterate their honey than farmers would make oleomargarine if they could. But for the sake of argument we will suppose that a certain few would do so. As in the case already mentioned, some neighbor or some visiting bee-keeper would be liable to discover some evidences of the practice, and report the same to the bee-papers at once. Honey-producers as a class, we firmly believe, are decidedly social in their relations one with another. They not only have State and county conventions, but visit back and forth. As editors of GLEANINGS we have visited the homes of hundreds of bee-keepers all over the country. We have come upon them unexpectedly, when their apiaries and bee-houses were in all sorts of disorder, but never have we seen the least evidence of any kind whatever, that glucose feeding for the purpose of producing comb honey had been contemplated or practiced. We know of just one who did do it, as above mentioned, and possibly there may be a few others; but their number, as compared with honest honey-producers who feel aggrieved and injured because of the mixing on the part of the city chaps is as nothing. Now, if we are wrong in our assumption — and possibly we are — we want the brethren everywhere to speak right out. If you do not wish to have your name as informant mentioned in connection with the matter, nor any thing done about it at all, say so; at any rate, tell us where you know of a producer who is engaged in the mixing business, and we will keep it "under our hat" if you say so.

But our friend Israel, as above, has made a good point as to *how* commission men may be imposed on — not, we think, by bee-keepers themselves, but by those who have bought from bee-keepers direct; for not all honey, if we understand the matter correctly, goes directly from the hives to the commission house. It very frequently passes through the hands of a second party. We should like to hear from honey-producers and other commission men in regard to this same matter. Let us have the truth, cut where it will.

REMINISCENCES.

REV. L. L. LANGSTROTH RECOUNTS, IN A VERY INTERESTING WAY, HIS EARLY CAREER.

I was born in the city of Philadelphia, Dec. 25, 1810, but a square off from old Independence Hall. My paternal grandfather was an Englishman, who, coming to that city on business for his grandfather, was so much pleased with the country that he made it his home, and married a young woman from Berlin. Settling near Philadelphia, he built one of the first mills in the British colonies for the manufacture of fine paper. At that time, the preference for every thing English was so strong that it was only after years of success that he ventured to put his own mark upon his paper. By his friends and acquaintances he was often called by the honored title of "The Peacemaker." He was noted for his skill in horticulture, and this once procured for him a visit from General Washington. An anecdote, which I had from the lips of my aged grandmother, will give a very good idea of my grandfather's character.

One winter evening, toward the close of his life, after reminding his wife how greatly God had prospered them, he showed her some papers by which he could establish his claim to a considerable estate in England. "But," said he, "my relatives there are much more in need of this estate than we are; and, with your consent, I should like to burn these papers." She told him that his wishes met her entire approval. The papers were thrown into the fire, and I have often sat before the old Franklin stove in which the cremation was made.

The mind of this venerable relative was so affected in her last sickness that she spoke no English, although it had long been familiar to her; but her prayers and hymns and Bible-texts were all in her German mother-tongue.

My great-grandfather, on my mother's side, was also of English descent, and his wife was a Lorraine, descended from a Huguenot who had been impoverished and exiled because he would not renounce the Protestant faith. It will thus be seen that English, French, and German blood flows in my veins. The children of our family who, in after-life, show marked traits of French descent, often begin to gesticulate, even in their cradle, with the index-finger of the right hand. I have inherited quite largely this French demonstrativeness.

The old family house is still standing in Chestertown, Md., built of brick brought from England by my mother's ancestors, as ballast to the vessels whose return freight was mainly tobacco from their plantations.

When I was an infant in the cradle, a careless servant, in the absence of my mother, threw on to the fire a rag saturated with sulphur, and left the room, which my mother, on entering, found filled with choking fumes. She had barely strength to snatch me from my cradle and rush to the door, and then, by a supreme effort, throw herself, with me still clasped in her arms, into the hall.

Very early in life I began to take an extraordinary interest in observing the habits of insects. My mother has often told me that, when I was about six years old, although my teacher reported me as doing well in other respects, she sometimes had to punish me for spending so much of my time in catching flies and shutting them up in paper cages. I remember very well how she once put me into a dark closet, after tearing up my cage and letting out my flies. I think that, if I were again in that room, I could, even if blindfolded, find the closet and creep into the corner where, as a little child, I cried myself to sleep.

Although my parents were persons of good intelligence, and in comfortable circumstances, they were not at all pleased to see me spend so much time in digging holes in the gravel walk, and filling them with crumbs of bread, pieces of meat, and dead flies, to attract the roving ants, so that I might better watch their curious habits. I know that I was once whipped because I had worn holes in my pants by too much kneeling on the gravel walks, in my eagerness to learn all that I could about ant-life. No books on natural history were given me; but I was considered a foolish boy whose strange notions ought to be severely discouraged. But nothing that could be said or done prevented me from giving to my favorite pursuits much of the time which my school companions spent in play.

Somehow I discovered that flies, apparently drowned, could often be brought to life by exposure to the sun's heat; and a proud boy I was when I made a practical proof of this fact to my incredulous companions. In my country rambles on Saturday afternoon (our only playday) I often brought home the nests of wasps, which I tied to the branches of sunflowers, so that I might watch with absorbing interest the maturing young leave their cells, and make so soon a vigorous defense of their homes. They did me no harm; but my companions were not always so fortunate if they ventured too close to my strange pets.

I can not show better the bent of my mind, and habits of observation formed so early in life, than by giving a particular account of what I noticed of the habits of the seventeen-year locust, and another species very closely allied to it — some of which could be found every year. I could not have been much over eight years old when these locusts first attracted my attention. Year after year I visited the Center Square, a public park of Philadelphia, to secure specimens and to study their fascinating transformations. The larvæ of these insects came out of the ground late in the afternoon; and I noticed that the holes out of which they crept were almost as smoothly bored as though made with an auger. As soon as an insect emerged from its hole it made for a tree or some other object, up which it could creep to a satisfactory height. If suddenly approached while in the act of mounting, it would often, "'possumlike," drop to the ground as if dead. After fastening its sharp claws into some chosen surface it remains motionless for a short time. When a larva first leaves its hole in the ground, its body feels quite hard; but before long it becomes almost as soft as dough. Now, in its soft state it can no longer crawl; and if prevented, before it became helpless, from getting a firm hold on some object, it would be quite impossible for it to emerge from its shell; but, fastened firmly by its claws, it soon began alternately to contract and expand its body, until what at first resembled a little crack on its back opened wider and wider, continually disclosing more and more of the emerging insect, until at last it raised its head and the larger part of its body from the shell, being prevented from falling out of it by the lower part of its abdomen, which was still held in the shell. It then looked considerably like an Egyptian mummy standing upright in its case, with its upper wrappings removed. Now, as the transition from their hard to their soft condition is a very short one, it is obvious that these holes, which are often bored through hard ground, must be made a considerable time before they are wanted, to enable the insect to push quickly through the little space that is needed to let it out, when its instincts teach it that the time is at hand for its coming changes. As soon as it has withdrawn its head, legs, and other parts of its body from the horny shell in which each was separately inclosed, it rests a while until its claws, which at first are too feeble to grasp any thing, become strong enough for it to climb out of its shell and cling to the rough surface on which it had fastened itself. Its wings, which are narrow and thick, can now almost be seen to thin out gradually, like a piece of dough over which a roller is continually passing. When they have reached their full expansion they remain thus flattened out until they become quite dry, when all of a sudden, by an involuntary motion, they assume the proper position for flight.

The locust lives only a short time as a flying insect, when the female bores holes into the extremities of small twigs, in which she inserts her eggs. The larvæ, when hatched, feed upon the twigs until the latter wither and fall to the ground, when they penetrate the earth, to reach the roots of trees, by sucking the juices of which with its sharp, hollow proboscis (as was discovered not many years ago by a distinguished lady), one species lives for seventeen years.

I was not over twelve years of age when I made most of my observations upon these locusts; but when I returned to Philadelphia, in the fortieth year of my age, it being locust year, I collected a large number of the larvæ from the trees in Independence Square, and sat up with my daughter and some of her school companions until after midnight to show them the curious changes just described; but from my boyish recollections I could have described them almost as vividly and accurately as I could after these last observations.

I did not confine my attention entirely to the insect-world. Catching mice, not fully grown, I put them into water until they were apparently drowned, and then, tying a string about their necks, wrapped them in cotton and placed them near the fire. After reviving, and disgorging the water they had been forced to swallow, they were quite willing to eat. If they offered to bite me, the water treatment was repeated until they became perfectly tame. In due time I could give them their liberty, and bring them at call to eat from my hand. Old mice might be drowned again and again, but they were always good for biting when they came to life; and I found that experimenting with them was like trying to "teach old dogs new tricks."

(Continued.)

CAUSE OF SWARMING.

TRIALS IN INTRODUCING.

In answer to C. C. Miller's request, page 613, it seems to me the question can be answered by one simple word; viz., "Nature." It is just as natural for bees to swarm as it is for them to gather honey. It is simply a natural provision for the propagation of the race. He further says, some people say it is best to let each colony swarm once; but those same persons think it would be a gain if the bees would not "desire" to swarm that once. Well, I don't think so, for two reasons. In the first place, it would cut off all increase unless "artificial;" and in the second place, the hives would be overcrowded, and bees would gather less honey. Some will doubtless say, "Give them more room"—a very good idea indeed; but, remember they must have room to work, as well as to store honey. It is just as easy to have a colony too strong as too weak.

A year ago I had one overcrowded in three stories, entrance open clear across the front, and an inch hole in the center of the front. I divided them, and either colony gathered as much honey as they all did together, thus proving to me that it is far better to let nature take its course this far, that is, to allow each colony (that desires to) to swarm once, and once only. I have known people to get their bees to sulking so they would do a mere nothing by returning the first swarm to the parent hive, time after time, and cutting out queen-cells.

I should also like to say just a few words in regard to introducing queens. On page 617 is an article headed "Introducing queens; even Doolittle Baffled." It is my opinion that this branch of the business will baffle any of the best of them so far as being "sure" of introduction. Several years ago I had only a few colonies; and early in the spring, long before there were any drones, one colony lost its queen. I sent off for a queen and introduced her by caging 24 hours; she seemed to be accepted all right, but the next day she was dead; and in a short time I took a queen from a strong colony, and introduced her by caging 48 hours. She was accepted, apparently, as the mother of the colony; but the following day she was dead. I then waited till there were cells nearly ready to hatch in the hive I had taken the queen from. I took a fine cell and coated it with honey; and after thoroughly subduing the bees with smoke I inserted it between two combs; but they tore it down and killed the queen. Then I took another cell and inserted it in a wire protector. The queen hatched in a couple of days, and they killed her; then I took another cell, just ready to hatch, and cut the queen out and let her run down between the combs after thoroughly smoking, and she fared no better than the rest. I then gave them a frame of brood in all stages, and they reared a queen of their own, and killed her. I repeated this operation from time to time, and each time they would rear a queen and kill her soon after hatching, until sometime in September. Then they reared a queen and allowed her to mate; and by her aid, and the occasional addition of a frame from other hives, they were fitted for winter.

Hillsborough, Wis., Sept. 10. Elias Fox.

[That bees swarm because it is in accordance with nature, no one will deny; but the problem is, how to overcome nature just as we do in other things whenever we may desire. Those who have out-apiaries are the bee-keepers who would like to do away with swarming. You see, it means either the constant supervision of an attendant, and that costs money, or runaway swarms, and that costs money. Automatic hivers may bring relief, but *they* cost money. If we can, then, it would be cheaper to take away the desire for swarming at out-apiaries, providing it does not mean a lessened honey crop.

With regard to your experience in introducing, there are rare instances, particularly those which have black blood in them, when any method of introducing will fail. It is useless to fuss with them when they get into the mania of queen-killing. They are like some people—they don't know when they are well off. With such a colony as you describe, we would scatter the bees (they are not supposed to have any brood) in eight or ten colonies, and move the hive away.]

BEE DIARRHEA.

DOOLITTLE ANSWERS A QUESTION ABOUT IT.

Question.—Last winter my bees contracted what is known as "bee diarrhea" quite early in the winter, and I wish to know what should be done with a colony of bees in winter quarters when the first symptoms of this disease appear.

Answer.—If the bees were in the cellar, and the temperature of the cellar were above 48° F., I would try cooling the cellar. On the other hand, if the temperature were 40° or cooler, I would try warming it up to the temperature first given, or a little higher. When the temperature of a cellar is just right it may be known by the quietness of the bees. The air of any room is always the warmest at the top, where any warmth-producing material is in the room, and for this reason I always place the strongest colonies in the bottom tier when putting them in the cellar; the colonies of medium strength as to numbers in the next tier, while all of the colonies having the smallest number of bees are placed in the upper tier. I have found by years of experience, that, if a strong colony becomes uneasy while in the top tier, it may be quieted by setting it on the cellar bottom, and that a small colony which is in a roar of disturbance can be caused to become as "still as death" by raising it from the bottom of the cellar up to the top; also closing most of the ventilation from the hive having the small colony will cause it to become quiet; and removing a whole top from an uneasy strong colony will cause them to quiet down and cluster compactly together for the rest of the winter. But all this should be attended to when the bees are set in the cellar, by putting them in their proper places in the cellar and ventilating each hive as it may require. If, in spite of all this precaution, some of them begin to spot the hive, I will say that, after trying all plans of cure, I now let them alone, for I consider it only a waste of time to fuss with them. If the reader does not agree, he can try giving them a flight in a warm room. Fix a box to set on top of the hive, the same having a glass top; or, should a warm day occur, carry the bees out for a flight; but after all this has been done, the bees will generally be dead before June, if they have the diarrhea bad enough to spot their combs and the inside of the hive during midwinter or earlier.

One thing which is always against this fussing with single colonies of bees which have become diseased is, that, by doctoring these, the disturbance required is apt to get other colonies uneasy and cause them to become diseased, while otherwise they would have gone through the winter quiet and all right. A change of food is sometimes beneficial; but, as I said before, the greatest success comes by letting them alone after placing them in the cellar, providing the temperature of the cellar can be controlled so it shall not go above 45 nor lower than 42 Fahrenheit.

STORING COMB HONEY.

Question.—How and where should comb honey be stored during winter? Is it necessary that the temperature in the room in which it is kept shall never go below the freezing-point? Comb honey which I tried to keep over winter last year cracked badly. Is it necessary to keep such honey in a warm room to keep it from cracking?

Answer.—I looked all through this query, expecting to find that this honey not only cracked, but that it granulated also, for I do not know that I ever kept any honey over winter where no pains was taken to keep it from the cold but that a part of it granulated, and the granulating of honey in the comb makes it more unsalable than almost any thing else which can happen to it which does not entirely destroy the comb. Comb honey should always be stored in a warm dry place during the fall and spring months at least, when a great change of temperature is likely to take place; but during the winter it may be kept in a dry basement-room or cellar where no frost ever reaches, provided you are on the lookout to take it out when the temperature on the outside rises much above that in the basement, otherwise the warm, moist, outside air, coming in contact with the surface of the cold or cooler honey, will cause moisture to stand in drops on the combs, when the honey will rapidly deteriorate. If I were trying to keep honey of any amount, which I wished to preserve in salable form, I would not let the temperature of the room ever go below 60°, while from 70 to 90° would be better. I once kept some section honey for three years, and found it better at the end of the three years than it was when taken from the hive. This honey was placed on a shelf about four feet from the floor of the sitting-room, right back of a base-burner coal-stove, during the time the stove had a fire in it; while during the summer months, when no fire was kept in the stove, the honey was carried to an upper chamber, facing the south, where the sun made the room very warm, in addition to the warmth coming from the kitchen stovepipe, which ran through this chamber. In this way the honey never "saw" a temperature of less than 60°, while from 80 to 100° was the rule much of the time. When I cut this honey it was nearly "jack-wax," and for quality it was not surpassed by any I ever tasted. I have often thought that it might pay to use this plan on a whole crop of honey during years when the production exceeded the demand, thus causing low prices to prevail, while the very next year might be a poor one, so that, thus keeping, it might double in price. When combs of honey are to be given to the bees, the cracking of the comb does no harm, for the bees will fix it up during the next season so it can not be told where the cracks were.

G. M. DOOLITTLE.

Borodino, N. Y., Oct. 3, 1892.

[There is no doubt but that honey stored away three years, as Mr. Doolittle describes, behind the coal stove in winter and in the garret in summer, will surpass by far in quality and richness any thing just taken from the hive. We should like to inquire whether any one has tried setting aside a whole crop of honey, as Mr. Doolittle suggests, keeping the same within a range of temperature of toward 100°. It is a question, however, whether such honey would bring more money in the market as people go so much by *looks* rather than by the *taste*, in their purchases. But there is a time coming, and we hope it will come very soon, when there will be a strong demand for this rich, ripe, thick, waxy honey. When consumers know what it is they will be willing to pay a big price for it — a price more than sufficient, we hope, to pay the producer for holding it over.]

SELF-HIVERS.

SOME EXPERIMENTS; A NEW DEVICE.

During the past season I did a great deal of experimenting with the self-hiver—not only trying all the known devices, but also originating many others never heard of, and perhaps never to see the light again. My faith in the self-hiver, after an experience with it of three years, is unbounded; and while my devices were imperfect my success was enough to convince me that the thing was not only practicable but destined to make a great advance in our pursuit. No doubt many others have conducted experiments on this line, and it is to be hoped that they will give their experience during the winter, as bee-keepers are greatly interested in knowing all that can be learned on the subject. It seems to me like foolishness, because one thinks he has discovered some new kink, to at once rush to the Patent Office, no matter how ill he can afford the expense, and where his money is usually lost to him for ever, in order to get a patent, a sort of notice to prevent the adoption of his devices. But I did not intend to switch off on patents, and will confine myself to the matter with which I started.

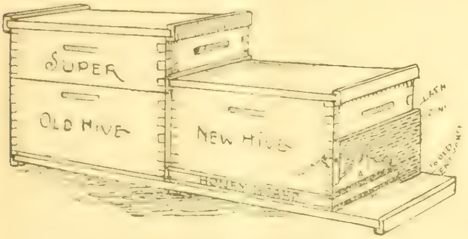
Last year my experience was not entirely satisfactory with the empty-hive-on-top principle, though by close watching and after-manipulation, I succeeded fairly well. There was no difficulty in getting the queen to run up into the hiver attached to the empty hive; and if one could always be present, it would be an easy matter to remove the old hive and thus secure all the swarm in the new hive. But if left to themselves, as would be the case in an unattended out-apiary, only a small swarm would be secured; and if left a number of days without attention it would gradually return to the old hive till only mere handfuls would be left, and would be liable to be overlooked in examining the hives for swarms.

During the past winter the devices of Pratt, Alley, and others were published in GLEANINGS, and they set me to thinking that it would be entirely practicable to secure the entire swarm, and as many more as the old hive could spare, without any after-manipulation. But after studying over the various devices a while, I decided that none of them would do the work without serious objections, and concluded to give the most promising a good trial before abandoning my old plan. Owing to my heavy losses in bees during the winter and spring, I had many hives of empty combs, and I thought that, by using these for hiving the swarms on, better results could be secured. I also used more wire cloth and less perforated zinc in my device, and generally secured larger swarms; but it was not an entire success. One thing learned was, that, during warm weather, a good many bees would take possession of the combs and keep them clear of moth, so there was no great trouble on that point.

While these experiments were going on I was trying both the Pratt and Alley methods, and soon found objections to both. The Pratt method, where the old hive rests on top of the empty one, works very well, secures good large swarms, and, if one could only tell when the bees had swarmed, it would not be very objectionable. But as the self-hiver will be wanted largely in out-apiaries, where the keeper can see them but once a week, it is another matter. Now, suppose I were to use this plan on an out-apiary of 100 colonies. I should have to lift off 100 full heavy hives, supers and all, just to see if any bees had swarmed. If you think this an easy matter, just try it, and I think you will soon be looking for something easier. Then, too, when the old colony becomes very strong they will often extend their combs into the empty hive, and many bees occupy it without having swarmed at all. In such cases the old hive must not only be lifted off, but the combs in the lower hive must be examined for queen or eggs, and this must be repeated on every visit. While all this *can* be done, it is too much work, and an easier plan must be found.

Mr. Alley sent me one of his very latest hivers, for which I was very thankful, although it cost me $1.50 for express charges. It was very late when it came, and I did not try it as thoroughly as I wished. I had a swarm issue through it twice on succeeding days, but somehow both returned to the old hive. In the second instance I saw the queen plainly in the trap, and a comb had been placed half an inch back of it, just as directed; but still, by evening nearly all the bees were back in the old hive. I am not ready to say that it will not generally catch the swarm, as I have too much confidence in Mr. Alley's statements, and think my experience was exceptional. Some experiments I had previously made on the same principles have convinced me, however, that, where there is no guard of any kind, the queen is often liable to return to the old hive. Then I do not see that Mr. Alley's device is a self-hiver at all. He simply aims to catch the swarm in an empty box, to be afterward hived by the keeper. It would seem to me that it should be called a new sort of swarm-catcher rather than a self-hiver.

I will now give the plan that I have finally adopted, and one that has so far worked to my entire satisfaction. In the first place, we want as few traps about it as possible, and to use such material as we already have, as far as practicable. I remove the hive expected to swarm, back its own length, and place a bottom in front, with the rear strip removed. On this I lay a queen-excluding honey-board, resting on the side strips, thus leaving a bee-space under it; connect this space with the entrance by bridging, the top of which may be wire cloth, but it should at first be covered by a board, to keep the bees from bunching on it, till they become accustomed to their new entrance. Lay ⅜-inch strips on the side and rear of the honey-board, to make an entrance for the new hive, and place the empty hive on it. Make a frame of lath, the size of the front of the hive, or less if the hive has no portico or projections. The lower strip should be placed up from the bottom, about an inch, so the upper edge will come flush with the honey-board, and it is to be provided with two or three wire-cloth tubes, for drones and queens. The direct entrance to the old hive is through the two lower rows of perforations, and under the honey-board. Now, when the bees swarm, the drones and queen find their way through the tubes, and remain only a few inches above their old entrance, and most of the bees will unite with the queen in the new hive upon their return. Now, when I find a hive that has swarmed (which can be readily ascertained by lifting off the cover) I place an inch-square stick in front of the old entrance, thus compelling all the bees to use the new entrance, and greatly strengthen the new swarm. Of course, some bees will continue passing through the honey-board to the old hive. This is all the manipulation necessary for from 7 to 14 days, when the old hive must be removed to a new stand, to give the young queen a chance to fly. This does away with my bee-escape method of strengthening the swarm. I get booming swarms; and if the surplus cases are changed to the new hives, the bees will keep right along at work in them, if any honey is coming in. If one is present when the bees swarm, the square stick can be placed, to cut off the direct entrance, while the swarm is out, and thus get all the swarm at once. The cut will fairly show my device; and I want to say that no patent will be applied for on it, and all bee-keepers are welcome to whatever rights I may have in the invention.



DIBBERN'S NEW SELF-HIVER.

One error, in connection with the self-hiver, into which many seem to have fallen, I wish to correct: that is, about swarms doubling up when several issue about the same time. From an experience of three years, with more than 200 hives each season, I do not recall a single case where swarms doubled up unless a queen was out somehow. June 28th I had five swarms in the air at once, and each quietly returned to its own hive. A number of times I had two and three out at once, always with the same result. There may be exceptions, but I am satisfied the rule is, that swarms *without queens* will not double up by going to a strange hive. Another error is the idea that the hiver will be useful only in small out-apiaries. I claim that it is just *the thing* for all kinds of apiaries, from the mechanic's or farmer's of a few hives, who is away all day at his work, to the bee-master with hundreds of colonies and half a dozen out-apiaries. C. H. DIBBERN.

Milan, Ill.

[So far as we can gather from our correspondent's article above, the Pratt automatic hiver works successfully, his only objection to it being the lifting of the upper story off from the bottom-board. Mr. Pratt's original self-hiver obviates this difficulty — that is, the hives are placed one in front of the other, on the same plan as illustrated above. Mr. Dibbern's arrangement, however, differs from Pratt's in that it provides for the egress of the drones, and is so constructed as to run the queen up into the perforated-zinc apartment in *front* of the entrance. But Pratt's tiering-up hiver is simpler than the horizontal plan, and hence we prefer it. The lifting of the upper story is no great objection. In the production of honey we never object to the lifting of heavy supers. The difficulty that you found with the Alley hiver was also the experience of Dr. Miller, as you remember. We quite agree with you that Alley's device is not a self-hiver, but simply a device to catch a swarm in an empty box, to be hived afterward by an attendant. "Swarm-catcher" would be a good name for it. The principal feature of the Pratt device, and which we think would be true of yours also, is, that it will hive a swarm and will not necessarily require the attention of an apiarist for several days. A hiver is not strictly automatic unless it does this.]

CAN WE HAVE A STANDARD SIZE OF SECTION?

DR. MILLER REVIEWS THE MATTER.

That wide-awake Frenchman, C. P. Dadant, put me down on the Albany program to open the discussion about the size of sections, without asking whether I knew or cared any thing about it. It so happened that I did feel somewhat interested in it, and studying the matter up a little has naturally increased that interest.

Before I forget it I wish to refer to that part of my paper at Albany which left the erroneous impression that I opposed the 1⅞ section on account of its weighing less than a pound. It is probably well known that "under-weight" sections are quite generally preferred. Whatever other reason there may be for their preference, it is unfortunately true that, in too many cases, they are preferred, because, going under the general name of "pound sections," these "under-weights" can be sold for the price of a full pound. How general this system of cheating is, I do not know. I do know that it is practiced by some of the most prominent and popular grocers in one of our largest cities. There is such irregularity in the weight of sections of the same size, it would seem the best way to sell every section by actual weight. But so long as that is not done, it is well to do every thing possible to prevent a section from being sold for more than its true weight. A 4¼x4¼x1$\frac{15}{16}$ comes so near to averaging a pound that many of them do weigh a pound each, and this gives a better chance for all to be sold, without weighing, for a full pound each. Now, I am glad to come down to a size so small that *all* will be less than a pound; for in that case the lack of weight would be more noticeable. If each section should weigh only half a pound it would not be possible to sell it for a full pound; and, on the same principle, the lighter it is, the less danger of selling as a full pound. For these reasons I decidedly prefer a 1⅞ section to any thing larger.

An esteemed friend has called my attention to the fact that differences in the width of sections do not make so much trouble as differences in the other dimensions. That is, if all sections were, say, 4¼x4¼ there would not be so much change of machinery needed to make all different widths from 1 to 2 inches as to change the 4¼ to 4½, 5, etc.; so if we could reach a standard as to height and length it would be quite a gain.

Now, I am glad to say that I believe we *have* reached a standard for the two dimensions. A table of the different sizes of sections made in a year by one of the large manufacturing concerns has been kindly submitted to me, and I find that about 98 per cent of all are 4¼ square. Surely that is a sufficiently large number to justify its being called standard, especially as the odd sizes are hopelessly divided up into 52 different kinds, and among these 52 kinds the most formidable rival of the 4¼ (4½ square) reaches only a little more than one-tenth of the odd sizes. It is noticeable that the odd sizes run larger than 4¼ square, the two largest being 6x6 and 8x4¼.

On page 19 the statement is made, that, at Albany, the commission men seemed to prefer larger and thinner combs, thus favoring 4½ square. Let me implore the friends who favor this last size, to do a little considering. It is only ¼ inch larger in height and length than the standard size. Can that trifling increase in size warrant keeping another size on the market? If a thinner section is wanted, the standard 4¼ can be made as thin as any other. There is one objection to 4½ square that would not hold against a size considerably larger; and that is, the fact that, being so near 4¼, there is danger of confusion wherever the two kinds are kept in the same place. At present I have sections measuring 1$\frac{15}{16}$ and 1⅞ in thickness, and I know something of the trouble of having two sizes so nearly alike that they must be held close together to tell which is which.

Is there any likelihood that we can reach a standard as to the thickness of the 4¼? I believe it now varies from 1½ to 2. Very few reach as high as 2, and very few want any thing less than 7-to-the-foot; so that, practically, the contestants may be considered four in number—7-to-the-foot, 1¾, 1⅞, and 1$\frac{15}{16}$. Possibly 1$\frac{15}{16}$ might come in as the "dark horse." For a long time I supposed that 1$\frac{15}{16}$ was the popular width; but, if I am rightly informed, 1⅞ is more in use. I changed last year from 1$\frac{15}{16}$ just because I wanted to go with the majority, and also because 1⅞ was lighter weight. I'm now ready to make a further change to 1¾ or 7-to-the-foot, if the majority say so.

Seeing, then, that there are only four kinds that are used to any considerable extent, and that there is so very little difference between these, it does not seem so utterly impossible for us to get down to two kinds, possibly one. Now, what means, if any, will be successful in bringing about such a result? The State and National Societies might do something by resolutions. But you may "resolute" till doomsday, and I'm not likely to make much change unless I see some good reason for it. How would it do for the manufacturers to agree among themselves to manufacture only the kind or kinds agreed upon as standard? I don't think it would do at all. If they are wise they will hardly attempt it.

No, the thing will not be brought about by any sort of compulsion. Indeed, I do not believe there would be any use in trying to get *all* to agree on one or two kinds. A man who has supers and all other fixtures adapted to a certain odd-sized section is not very likely to make any sudden change. But if I see that, in the long run, there will be an advantage gained by changing, and that change can be made without great inconvenience, you may count on my making that change. In this way I think it not unreasonable to expect something like a natural gravitation into one or two standard kinds, that gravitation perhaps materially accelerated by a little friendly consultation.

Suppose I am using 4x4½, and no one else, or very few, use the same size. When I send for sections there are none of that size kept in stock and I must wait till they are made. If the manufacturers are crowded with work on regular sizes I may have to wait a long time. This of itself is a pretty strong argument in favor of my coming in with the majority. Then the manufacturer says to me, "There is so much call for the standard kind that we keep thousands of them made up ahead, all packed ready for shipment, and can ship that kind any day you send in your order. Besides, we make a very large quantity of the standard at one time, necessitating no change of machinery, so giving you a little advantage in the lower prices we can afford." Unless I am very pig-headed, that sort of argument will have its effect on me; and just as soon as I can do so without actual loss I am likely to adopt a regular size.

Now, who will tell us which of the leading widths is best, giving reasons therefor? Isn't there some reason why one is better than the others? If there is no particular reason in this case, and each one uses a particular kind just because he happened to get started that way, then the question is, "What width or widths are in the majority?" Perhaps, Mr. Editor, you will be kind enough to tell us about that. So far as any thing occurs to me just now, the argument in favor of something as thin as or thinner than 1⅞ is, that bees generally seem to prefer nothing thicker than that, and that any thing thicker, at least as it seems to me, helps to perpetuate the system of selling short weights for full pounds. Against any thing as thin as or thinner than 7-to-the-foot, it may be said that, when separators are used, this comes so near to the width preferred by the bees for brood-combs that there is more danger of pollen being stored there, and the queen depositing eggs. C. C. MILLER.

Marengo, Ill., Sept. 29.

[Bee-keepers will have what they want—that is, what their supers take and markets call for, in the way of sections; and supply-dealers can do but little toward regulating a standard size. We have practically only three sizes as standards; viz., 1⅞, 1$\frac{15}{16}$, and 7-to-the-foot — all 4¼ in. square. We somewhat question whether it would be feasible or even desirable to have less. Producers and the various markets have their various likes and dislikes.

Referring to the 1⅞ section, there are two important reasons why they are taking the lead. Wood separators are so much better and cheaper that bee-keepers everywhere have adopted them where they could. As the majority of supers in use took the 1$\frac{15}{16}$ section with *tin* separators, it precluded the possibility of using *wood* separators *unless* a narrower section were used; namely, 1⅞. This fact, coupled with the other fact that the markets demanded a lighter section, made the 1⅞ the leader. Why are light weights desirable? It may be answered in this way: A buyer comes in and inquires the price of honey per pound. "Sixteen cents," is the reply, we will say.

"Well, I will take a section. How much is this one worth?"

"That is worth 13 cents."

No objection is made; but if he is met with the statement that the section is worth 18 cents he may demur. Again, sections are being sold more and more by the piece; and consumers generally understand that a section of honey is usually of light weight—that is, hardly a pound, and when they are charged less there is no objection. Again, for the same money a thinner comb shows off better than the same weight of a thicker comb. Next to the 1⅞ and 1$\frac{15}{16}$ size of section, the 7-to-the-foot takes the lead.]

RAMBLE NO. 69.

BEE-KEEPING AROUND JURUPA MOUNTAIN.

The Riverside apiary, described in Ramble 65, is situated upon the extreme eastern point of a broken range of mountains, about seven miles in length and not over a mile in width, and known as the Jurupa Mountains. The formation is, in many respects, peculiar, and it is evident that some convulsion of nature thrust them up here in the center of a plain, or it might be called a prairie. These mountains are nothing more nor less than piles of huge granite boulders. The granite in some places is quarried for building and monumental purposes. Upon another detached mountain near Colton, less than two miles in circumference, are limekilns, cement works, marble-quarries, both white and variegated, and an occasional pocket of onyx. In the Vermont quarries the stone is found in large and inexhaustible masses or seams; but here it is in large boulders; and when one has been quarried it is not certain that another of like quality will be found. There are also traces of gold and silver, but it is found in quartz pockets, and scarcely pays for the investment of capital to develop.

To give some idea of the honey resources of this little range of rocks, with the aid of Mr. Clark on one side and Mr. Wilder's broncho on the other, I obtained some notes and snap shots from the saddle. Setting out from the Rambler's cabin and following down the north side of the range, after a mile of travel we find the apiary of Mr. Choate. Here are 100 colonies, and a new and complete honey-house; and, though the stocks were very weak in the spring, the surplus amounted to 2500 lbs. With his bee-keeping and ranch work Mr. C. puts in his spare time in the large cannery at Colton.

Within half a mile of Mr. Choate's is a newly established apiary of 50 colonies, owned by Mr. Vaughn, who also lives in Colton. We now proceed nearly a mile further, and in front of the broad and level Cucamonga Valley we find the 200-acre ranch of Mr. W. E. Clark, with cattle, horses, poultry, and peach, orange, apple, and fig trees, and 170 colonies of bees. While Mr. Clark operates the ranch, Mrs. Clark operates the bees and proves to be a skillful operator. This apiary was started about six years ago, from two colonies that were dug from the rocks above the ranch. Being novices in the business, the bees were first put into various nondescript hives; but learning of the better management in movable-frame hives, the swarms were properly transferred. After an increase of 57 swarms from 17, and considerable honey in one season, the bee enthusiasm increased, and the apiary now numbers 170, and the product this poor season was 10,800 lbs. Of course, they believe bee keeping pays, even in a poor season. Mr. and Mrs. C. belong to the class of hospitable Californians; their latch-string not only hangs out, but their door is wide open, and the weary traveler is always welcome. The nearest neighbors are two miles away, and one of these, a Mr. Button, with a poor season before him, commenced with 25 colonies; increased them to 50; sold some stocks, and secured 2000 lbs. of honey, a few colonies "giving down" at the rate of 200 lbs. each.

Down toward the west end of the range we find the apiary of Mr. Langton, an Englishman who came to California with barely a hope of saving his life from the serious inroads of consumption; but the climate has given him a measure of good health and hope for many years yet on this terrestrial ball. We found Mr. L. very busy hanging out the family washing, which showed a very helpful spirit toward the busy hands in the house. Mr. L., during this very poor season, has increased his bees from 33 to 62, and secured 5400 lbs. of honey.

HOW MR. LANGTON PREPARES KEROSENE-CANS FOR HONEY.

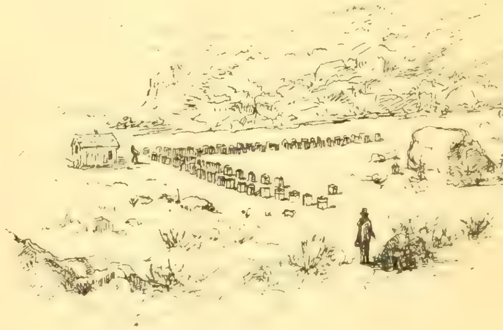
His honey is put into kerosene-cans; but if every one used the care that he does there would be no kicking from buyers. In the first place he takes the entire top from the can. This gives ample chance to discover any thing wrong in the interior. If it is rusty it is rejected; if not, it is thoroughly cleaned, and a new top with screw-cap is soldered on, and the can is practically as good as new, and at much less cost. The way many prepare kerosene-cans for honey is, to put a patch over the oil outlet; put a screw-cap and handle on what was the bottom. That puts the brand that betrays the can at the bottom; but it is a kerosene-can all the same, and not so commendable a plan of transformation as Mr. Langton's. A little less than a mile from Mr. L.'s we found another bee-keeper, Mr. Bloom. His first colonies were also dug from the rocks and planted at the base of the mountain, where they had grown to a good apiary; and 72 stocks in the spring of this very poor season had increased to 110, and given 11,325 lbs., or over 100 lbs. to the colony. This is the last apiary westward on the range, and the valley broadens out here and stretches away off toward Los Angeles. The yields of honey at this point and further down the valley were better than upon the eastern end of the range.

Mr. Bloom has now made arrangements to sell 100 colonies next season for $1.00 per colony, the purchaser to furnish the hives. He puts in no *ifs* and *ands* about their wintering, as he is quite sure of that part.

From this point a lone and deserted cabin is pointed out on the plain, where a lone bee-keeper was murdered and his body cremated under the burning material of his barn. So, lone bee-keepers do come to a bad end; but it is where perhaps enemies follow up their victim to avenge some wrong.

We now pass around the mountain and work our way up the south side; and a young man, Mr. Rance, from 25 colonies in the spring increased to 50 and secured 3120 lbs. of honey, which is not bad for a young man during this poor season.

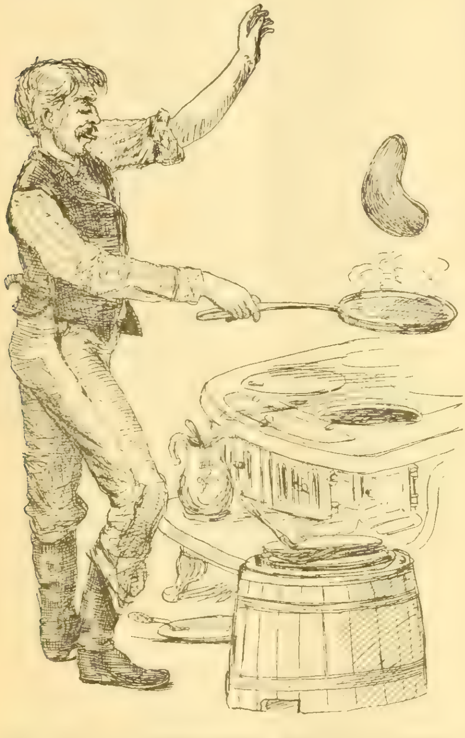
Another hitch along the base of the mountains, and we enter a very rocky and cup-shaped canyon; in fact, it is almost an amphitheater, with its abrupt rocky walls on three sides. Here is an apiary of 115 colonies, owned by our friend Wilder, of Grayback and watermelon fame.



H. E. WILDER'S APIARY IN WILDER'S CANYON.

Mr. Wilder searched for a long time to find a location that would fit his name, and finally succeeded. The sketch shows that stones abound, both above and below, and of a size to suit the most enthusiastic admirer of stones. In the rocky pass above the apiary it is Wilder's wildest, where rocks seem ready to roll down of their own accord. The cabin, as shown in the cut, is about as large as the big rock shown at the right, and is located near an unfailing spring; and upon a day when the mercury gets to the 100 mark it is wonderful to see the steady stream of bees that pass the cabin for water. In this rocky retreat Mr. W. has, in this season of uncertainty, taken 9120 lbs. of honey, and seems to have no appearance of the blues.

This retreat abounds in small game. Both rabbits and quail can be shot from the door of his cabin. As our friend is an expert cook in all of its departments, quail or rabbit on toast is served in the most epicurean style, and the California flap-jack act can be performed to perfection.



MR. WILDER PERFORMING THE CALIFORNIA FLAP-JACK ACT.

Mr. W. is a skillful taxidermist, and samples of his handiwork are visible in the shape of rare specimens of California birds. The only missing links in the chain of his enjoyment are a helpmeet and a generous patch of watermelons.

Messrs. Helmer & Pratt have a flourishing bakery at Riverside. The Pratt portion of the firm devotes a part of his time to the cultivation of the busy bee. Near another spring that seeps out of the mountain is this apiary; 43 colonies in the spring increased up to 98; and 4000 lbs. of honey, secured as the product of this apiary, is sold to a great extent in the bakery. Both comb and extracted honey are produced. Speaking of selling honey in this way, Mr. Pratt said they sold for a little better price; but as it came in littles and went in the same way, they didn't feel the profits so much as when sold in a lump, and they could handle a roll of bills or a bag of gold. This season migratory bee-keeping has been practiced by them. The bees have been removed to the river bottoms with good results. A few colonies kept in the city put in some fine orange-blossom honey, some of which we hope will find its way to the World's Fair.

The nearest apiary to Riverside, on this range, is owned by Mr. Parks. His hives are among great rocks just above his ranch, and he has the reputation of securing the largest yields of any bee-keeper in the vicinity. This very poor season his yield from 65 colonies is only 6000 lbs. Three years ago he had a good season, and his 75 colonies gave him 33,000 lbs., or an average of 440 to the swarm. Mr. P. believes in a liberal use of foundation, and combs that get clogged with bee-bread are taken out and replaced with it. He believes in using a three-story hive, and wants a queen that will keep 10 frames filled with brood. His ranch and orange grove, however, encroach so much upon his time that he thinks of disposing of his bees in a year or two; but, speaking reflectively, he said if we have another season like this California will lose its reputation as a large honey-producer.

Mr. Samuel Ferguson, who was with us on Grayback, owns the next ranch and apiary, and, like Mr. Wilder and the Rambler, he is a lone "bach." He has a cosy cabin enbowered under eucalyptus and pepper trees. Water is developed in the canyon above, and a reservoir is nearly completed to collect water to irrigate the ranch. The apiary numbers 215 colonies. The hives are in two double rows. A track is laid between the rows, and a car is used to run the combs to the extractor. The hives are covered with a framework for shading them in hot weather. The shades were not in place this season, owing to the short yield of only 11,000 lbs. Mr. Ferguson seems to have every thing ready for a bird in his cage, but the birds around the cabin seem to be mostly quail.

A little apiary, owned by a consumptive, and another of seven hives, complete the circuit of the mountain, and we find on the seven square miles 1287 colonies in 14 apiaries, counting both great and small. The total amount of honey sold was 76,500 lbs.; and although the bees were on the seven square miles embraced in the mountains, their field of operations was on valleys ten miles wide. The sources of nectar were sage, orange, wild buckwheat, hoarhound, sunflower, and wild flowers in profusion. Excepting the temperature, which was up to 100°, I had a very pleasant journey, and some thrilling experiences which will next be duly recorded by the RAMBLER.

COVERS TO DOVETAILED HIVES.

INTRODUCING; HOW THE QUEEN USES HER STING.

The cover of Dovetailed hives of your make is not good enough, for it catches the rain and moisture, and will lead it right into the hives. If the top were made exactly like the bottom it would be an improvement. I for my part would have it just two inches wider, and have end and side strips to run down about one or two inches over the body of the hive. I had extra gable-end covers made for all hives, and thus have a better shade in summer and a dry home for bees during winter and spring.

Some time ago you stated the different views of bee-keepers on the so-called raking of bees as a sign of swarming, etc. It means a thunderstorm and nothing else.

Queens do sting, if they find chances in their favor. During last year I experimented in the following manner: One queen was left with a number of her own bees in a Benton cage several days. Then I removed the bees and gave one bee from a strange colony. It instantly attacked the queen, but was very quickly killed by her. One queen killed as many as six bees. A virgin queen also fought for life. Put in many bees and the queen will not fight at all. These experiments are in accordance with the laws of nature as noticed with other animals that are known as fighters, and why not with the bees? If the queen sees a chance of success she will fight the enemy, be it ant, bee, or any thing else; but why should she fight if a dozen of daggers are ready for her?

During last winter I made another observation of value to some of your readers. Instinct (and nature) is certainly a great thing with animals. I keep message doves. In November the cold spell endangered the young homers, so I placed some in my room. When six weeks old, a second pair, with only the mother, was caged. One fine day the mother-nurse escaped from the cage and flew out of the open window, home to the belfry. Then I took one of the youngsters of six weeks, and placed it with the two younger cousins only five or six days old. The first hour was one of astonishment, the second of admiration, and the third, motherly love, as of old, and the two little pets were fed more than any pair will feed their young. Ever since, I remove the young as soon as they show signs of feathers, and place them with such an extra nurse. The lesson is a great one. Kindness toward fellow-creatures is a natural law. With animals, instinct tells them how; with human beings, the intellect, God's great gift, tells us how to show charity to those in need.

One word about introducing queens. Give the queenless colony a new hive and new bottom-board; and then place the cage, with new queen, as per directions on your Benton cages. This will greatly insure success. Another way would be to have a wire screen in shape of a wide frame, wide enough to cover a comb. Place a comb with hatching brood in this wire cage, and let the new queen loose on it. Place the screened comb in the center of the colony two or three days, and all will be done well. This plan has only one advantage; i. e., the queen will begin to lay at once, and this is one great success. I had one that came from Maine; and before 15 minutes she was at work laying eggs. To have her in the small cage, and let bees release her, would have retarded the work 24 or 48 hours. Such a screen cage can be made by any one who can handle carpenter or similar tools. You could keep them for sale for such as are unable to get them at home.
P. STEPHEN STENGER.

St. Meinrad, Ind.

[We can make the cover just as you want it, side strips and all; but that would destroy the very feature which so many prize—that is, the facility for *sliding* the cover on to avoid killing bees. With the non-burr-comb frames of to-day, this feature is a valuable one indeed. If you are careful in putting on covers you will not need any side strips. Hundreds of bee-keepers will testify to that. Moreover, the bees, when left to themselves, will propolize points of contact between the upper edge of the hive and the under side of the cover so perfectly that no rain can beat in. Propolis (that great bugbear of bee-keeping) right here does a good service. It not only keeps the top of the hive tight and warm, but it prevents the covers from being blown off by every little wind, and thus renders unnecessary the use of clamps or hooks to hold the covers on. Of course, if you use enamel cloths, or any kind of covering over the tops of the frames, the board covers will have to be fastened down, and then it will be quite necessary to have the side strips so as to make practically what is known as the telescopic cover; but when one is used to the plain cover over non-burr-comb frames, he can not but wonder *why* any one would want the extra cloth or covering.

With regard to the washboard act on the part of the bees at certain times in front of the entrance (raking, as you call it), we can not believe that it signifies any peculiar phenomenon in nature, either of swarming, thunderstorms, or any thing else. We have observed it at all times when the bees had nothing else particularly to do, without any subsequent swarms or thunderstorms. It is our opinion that the bees do that simply because they have nothing else to do; and in the same way they will gnaw at sprigs of grass, small weeds, etc., that stand in the way of the entrance. "As busy as a bee"—if they can not do one thing they will do another.

It is not denied in the text-books that queens sting rivals, and, occasionally, workers; but it is indeed very seldom that they sting a human being; but they have been known to do it in rare instances, and this brings us to a case that perhaps we have never mentioned. Some years ago we had an old hybrid queen in one of our yards that we could let right loose in any hive. If the bees commenced to grab hold of her she would simply paw and fight them like a wild tiger; and instead of the bees intimidating *her* she intimidated *them*. We used her repeatedly for giving eggs and larvæ to colonies that were short; but we never had any other queen that we could use in a similar way. She was only a hybrid, and not worth much, and we let her loose in a great many different colonies without even the formality of the ordinary methods of introduction. If we remember correctly, she simply died of old age. Such a queen (and they are very rare indeed) would be valuable in many queen-rearing apiaries; because it is easier to "drop" brood in this manner into a colony rather than to go and hunt it up of the right age from some other stock.

We very much question whether the new hive or new bottom-board had any influence in the matter of introducing. On the contrary, the less the internal arrangement is altered, and the less the routine of affairs is interrupted, the better will be the chances of the queen being introduced, other things being equal. The wire-cloth cage you mention is used by quite a number of practical bee-keepers—notably, J. F. McIntyre, of Fillmore, Cal. We know of no better cage for introducing; but it is good only for that purpose and for nothing else. It is a simplification of the old Peet method used so successfully two or three years ago, but now abandoned, because a more successful *mailing*-cage, as well as an equally good one for introducing, was devised.]

PLANTING BASSWOOD FOR HONEY.

J. A. GREEN RECOMMENDS THE PRACTICE; GIRDLING TREES.

I have always opposed the planting of special crops for honey, and I do not think that such a course can ever be made profitable. But there are times when, in planting, we may do so with an eye to the honey that the crop will yield. One form of this should be encouraged by all who have an eye beyond the immediate present. The planting of basswood-trees for shade wherever shade-trees are needed should be encouraged by all possible means. As a shade-tree, the basswood is entirely unobjectionable, and has many points in its favor, considered aside from its value to the honey-producer. Of its great value to the latter it is unnecessary to speak. There is probably nothing that will produce as much honey from a given amount of ground as basswood; and, once established, it will grow for many years without attention.

I noticed something last summer that was interesting, and may prove to be of some practical value. A year ago last June I went to the woods to get some basswood bark to use in budding roses. The bark cut at this time, and soaked for several weeks in water, splits into a number of thin layers of very fine, strong fiber, useful for budding as well as many other purposes.

I went to a place where basswood-trees had been cut eight or ten years before. The sprouts around the stumps had grown up to a considerable height, and many of them were four or five inches in diameter. Selecting a smooth sprout I removed all the bark from it for a distance of about three feet from the ground. Last June, a year later, I went there again for the same purpose. One would naturally suppose that the sprout that had been girdled the year before would have been killed by the operation. The bark, as I said before, had been entirely removed for a space of three feet or more. There was no new growth of bark over it, and the entire surface that had been exposed seemed perfectly dry and seasoned for half an inch or more from the outside; yet the sprout seemed to be growing and thriving just as well as the others from the same stump. What was particularly remarkable, though, was, that *that sprout was covered with blossoms*, while none of the other sprouts from the same stump had any blossoms on at all.

It is said that apple-trees may be brought into bearing much sooner by girdling, without injury to the trees; and I know from my own experience that girdling grapes causes them to produce earlier, larger, and finer fruit.

This opens up a way of great possibilities. It might not pay to set out trees and girdle them all; but it might pay to set out a double number and girdle half of them, with the expectation of removing those girdled in case the girdling injured their growth. Where there are sprouts from the stumps of trees that have been cut for some years, I think it would certainly pay to girdle a part of them. If in this way we can have our basswood-trees blooming again, or if we can hasten the blooming of young basswoods by several years, it will be a great gain, and may be of great value in some localities.

It is probable that the removal of half an inch or so of bark would have the same effect, and that this would grow over again without any more injury to the tree than the maple-tree receives from the yearly tapping. I have girdled some more trees, and shall watch them with interest next season.

WHY DON'T THE BLOSSOMS YIELD HONEY?

The season of 1892 has been to the bee-keeper of this locality one of abundant promise, with a most plentiful lack of fulfillment. White clover abounded, and the copious rains of the spring and early summer seemed to be just what was needed to get it into good condition to yield honey when once we should have that hot weather that seems to be essential to the secretion of nectar. But the flow from this source was at no time heavy; and when it closed its brief career, but few colonies had done much more than to fill up the empty cells of the brood-chamber. Basswood bloomed freely, and I confidently looked for a good yield from that source; but the blossoms were visited but little by the bees. I think I never before knew it to be so neglected when there was an abundance of bloom. But although our hopes for a good yield of early honey were thus dashed, we did not by any means despair. Had not the superabundant rain left hundreds of acres unsown and uncultivated? This was just what was needed for a good crop of heartsease. The heartsease grew and thrived; and when its blossoms began to give their rosy hue to stubble and fallow land, and fringe the fields of half-grown corn, it seemed that the prospects of the bee-keeper were never brighter. Again the scent of newly gathered honey filled the apiary. The first set of extracting-supers had been filled, and a start made in the sections, when a heavy rain, followed by cool weather, put an end to honey-production. Heartsease usually yields honey until it is killed by the frost, but this year the blossoms do not seem to open, and the acres upon acres of it are yielding no honey since the cool weather began. In other years I have known the bees to gather considerable honey from it at times when it was almost too cold for them to leave the hive; but we have had some quite warm days lately that seem to have no effect in starting the secretion of nectar again.

The experience of this year shows so plainly that the secretion of nectar does not depend simply on the amount of bloom, but upon climatic and atmospheric conditions that are entirely beyond our control, that it seems to me that any attempt to increase the yield of honey by planting special crops rests on a very uncertain foundation. The three principal sources of honey in this locality have grown and bloomed abundantly this year, yet have yielded little or no honey. One might plant crops of honey-producing plants for several years without getting any return from them whatever in the way of honey. Any attempt to increase the yield of honey by planting a crop that will not be profitable aside from the honey that is expected, is liable to result in failure. Of course, there is no reason why waste places may not be profitably planted to something like sweet clover, that requires no cultivation, and will seed itself and grow from year to year. Great caution should be exercised in this, though. People are apt to be very suspicious of any thing planted in this way, even though it may be harmless. The innocent sweet clover is persecuted as a deadly enemy, when burrs and other noxious weeds are allowed to go unmolested and with scarcely a thought.

Dayton, Ill. J. A. Green.

[I think that, in your case, friend Green, the trees had been growing with too much vigor to produce bloom. One remarkable feature of the basswood is, that, when you cut a tree down for timber, the strong vigorous roots will at once send up sprouts that will very speedily take the place of the original tree. These sprouts grow, of course, with great vigor, and on this account they seldom blossom until of considerable size. The matter has been referred to in these pages. Your girdling, however, proved to be just the proper sort of check on their rampant growth, hence the blossoms. Strong-growing trees often survive girdling, just as you describe; and the practice of girdling to promote fruit-bearing has been in vogue for many years. I agree with you, that the basswood seems at present to furnish a larger quantity of honey than any other one plant that has been brought to our notice. I do believe that the planting of basswoods for shade-trees, and, very likely, for timber, will be the means of keeping up our industry. Possibly our children or grandchildren will be the ones, however, to reap the honey crops. Our own basswood plantation has been out now 20 years. The ground is some of the poorest in this part of the State. Notwithstanding this, however, many of the trees are a full foot in diameter. They have not blossomed as profusely, as yet, as some other basswood-trees planted about the same time, or a little later, on the streets of our town. There are now a dozen or two of the latter that have been for several years as full of bloom and as full of bees as any tree I ever saw, either in the forest or fields. One tree in particular is now about 30 feet high, and its branches extend to a distance of fully 15 feet in every direction. This tree I helped to set out less than 20 years ago. The soil and situation are favorable.] A. I. R.

BOARDMAN'S SOLAR WAX-EXTRACTOR.

HOW IT WORKS; NO WAX IN THE REFUSE.

Friend E. R. Root: In your "Notes from the Bicycle," in GLEANINGS of Sept. 15, you jagged my memory in regard to the talk we had when you were here over the solar wax-extractors, or I should likely have forgotten my promise to test the residue, or slumgum, by rendering it over with sulphuric acid, and thus save, as you hoped, some precious dollars, more or less—enough to more than pay me for the trouble.

I had no expectations of finding wax in paying quantities, but I was just a little interested to know how well my solar extractors did their work. After procuring some sulphuric acid I looked up in back numbers of GLEANINGS the *modus operandi* of rendering wax by this process, and proceeded accordingly. Into a five-gallon stone crock I put 2½ gallons of soft water, and added a little over ¼ lb. of sulphuric acid. I then went to a barrel of the residue, the same that we examined when you were here, and from it I filled up the crock and left it to soak until next day, when I placed it upon the stove in the bee-house kitchen, and let it boil for some time. Then I let it remain and cool gradually. The next morning I went to investigate the results. Well, now, how much wax do you think I found cooled in a beautiful yellow cake on the surface?

"Two pounds?"

"Well, no."

"One and a half pounds?"

"Hardly."

I was disappointed, and I am sure you will be when I tell you there wasn't any—no, not a trace of any thing that looked like wax. Let me say I smiled as I passed the solar extractors that morning, and said, kind o' softly, "That was a pretty good joke you have played upon us."

I have tried about all the plans for rendering wax that I have heard suggested or could think of, and I would always find in the residue, after it had cooled, more or less wax in little yellow particles dispersed all through the mass. I was never satisfied with such wasteful methods. The solar extractor gives the only method of rendering wax that satisfies me.

It might not be out of place to say here, the larger extractors give the best results. I should prefer them still larger than I now use. I think this is all the secret of my success with them (having them large). I can't see how the small ones that are used by so many bee-keepers can be made at all practical. The only imperfection I meet with in this method of rendering wax is, it will not work without sunshine. In this respect the solar extractors are somewhat like A. I. Root's old windmill for power, which would go only when the wind blew.

I shall continue to use this wax residue for fuel, the only thing for which it has any value; and for this purpose, and especially for kindling fires, it has no equal. When the thrashers came this fall I had no coal for them to steam with, as they came unexpectedly; so I took out some boxes of slumgum, and said to the fireman, "Try that." He did try it, and up went the steam; and he said it beat any thing he ever used to fire with before. "Now," said he, "I shall have a good story to tell when I am an old man, how I once fired an engine with bee-comb.

H. R. BOARDMAN.

East Townsend, O., Oct. 7.

[We give you the reputation of being a careful experimenter, and the credit of generally being right in your conclusions; but in this case we are not quite ready to give up yet. The very fact that this "slumgum," or refuse, makes a fire equal to or better than coal, for steaming up a thrashing-boiler, is evidence to us that there is considerable money left in it, in the shape of unrendered wax. To back our assertion we propose that you ship us by freight two or three bushels of that slumgum; and whatever wax we can get from it by the use of sulphuric acid, if any, will be credited to your account, and the result either way will be reported through these columns. We may have to give up, but our experience with our own slumgum says no.]

FEEDING BEES TO STIMULATE.

A NOVEL FEEDER MADE OUT OF A QUART CAN AND A WIRE NAIL.

We have kept bees for fourteen years, and have had our share of trouble in spring feeding, that is, between apple and clover; and if the latter be of short duration, the feeding of a few pounds may make the difference between a fine lot of surplus and a complete failure. The Heddon wood feeder worked well, but was too bungling and expensive for spring use, and became so foul that we were glad to burn them.

To make feeding a success, you must be so prepared that, within one day or night, you can have feeding in full blast on every hive, be it raining hail and pitchforks. For three years we have been successful with the following:

Having 70 colonies we bought 70 one-quart tin cans. In the bottom of these cans, with a smooth awl, and from inside out, we punched a hole large enough to drop a ⅝-inch flat smooth-headed wire nail in easily, but leaving a good catch for the head. All our hive boards have a two-inch hole in the center, covered with a block which becomes glued, and these give us no trouble when not in use. We place these cans over these holes; carry a faucet can of 70 lbs. of honey to the center of the yard, and, by the use of a large coffee-pot, we have, in 20 minutes, 70 colonies fed each a pound, more or less, as desired, and not see a bee, nor chill one either. The wire nail makes the feeder work automatically. By looking into the can after feeding, you will see the head of the nail shaking about. This is caused by the bees. It regulates the flow, and keeps any sediment from clogging the feeder.

I just tried two cans filled with water. They held the water for hours; but on agitating the nail, as the bees do, the water ran out in a little stream. Fortunately we have had no fall feeding to do for some years, but we think one can would do for each hive if fed day and night after each feed at night, without stimulating breeding. By bending one edge of the nail-head up it will make more of a force feeder.

F. S. COMSTOCK.

North Manchester, Ind., Sept. 13.

[At first we thought our correspondent had struck on the old pepper-box feeder (a very good one, by the way); but by reading more carefully we discover that he has a feeder on an entirely new plan. We have no doubt that it will work very nicely, and do as he says.]

LADIES' CONVERSAZIONE.

SULPHURING WORMS IN COMBS.

MISS WILSON TELLS HOW THEY DID AND DIDN'T SUCCEED.

After reading, on page 664, Mrs. Axtell's trouble with extra combs, I thought I would report how we came out with ours. After hanging them in the shop cellar we let them alone, except occasionally to look at them to see if there were any worms at work. They hung there a good many weeks without showing any signs of worms. I began to think they were not going to trouble, but no such good luck. Upon taking down a frame for examination, one day, a good-sized worm was discovered; and by looking further, quite a number were found, some of them full grown. We concluded it was high time to fumigate. After a worm is nearly or quite grown it takes considerable sulphur to kill it; so we concluded to use enough to make a sure thing of it. We got 20 lbs., put it on the cellar bottom in four dishes, set fire to the sulphur, and shut the door. The rooms above were blue with smoke, and smoke issued from every crevice, so we concluded it was burning all right. We did not open the door for two days, when we discovered the fire had gone out in two of the dishes. On weighing what was left, we found that only 8 lbs. of sulphur had really been burned.

I was very anxious to find out whether the worms had been killed or not, and it was with no little interest that I examined the combs; and when I came to a big worm all shriveled up and dead I gave a big whoop of delight and called Dr. Miller to come and see that it was really and truly dead. We had neither of us felt very sanguine about the large ones being killed, as our previous efforts had not been entirely successful. But there was no disputing the fact now. We never found even one alive. We left the cellar-door open, and it has stayed so all summer. Combs have kept nicely, and no more trouble about worms. I don't believe I'll ever worry so again about keeping combs as I did this spring.

Mrs. Axtell, don't you believe if you had hung your combs overhead, so as to have them further apart, the smoke would have got at them better?

From past experience I should say there is no use to smoke lightly when the worms have attained any size, and one heavy smoking is worth a great deal more than several light ones. We used about one pound of sulphur for every 275 cubic feet, which varies very little from the amount recommended by Mr. Doolittle. Another point of importance, I think, is to keep the room closed a day or two so as to retain the smoke as long as possible. We might have smoked them earlier, before the worms got quite so large; but by waiting as long as we did, all eggs were hatched, and no subsequent fumigation was needed.

After writing the above I went over to the shop cellar to count the frames we had left hanging up. I thought we had used about two-thirds of them; but I found we had only 260 left. In counting them I found 5 combs in one place and 2 in another that had, by some means, been pushed up close together, and they were fastened solid together with cocoons and worms, and were utterly ruined, so I shall have to take back what I said about there being no worms. None of the other combs were affected, which is very strong evidence that placing them an inch or two apart is very essential.

Marengo, Ill., Oct. 5. EMMA WILSON.

UNCLE TOM'S CABIN OF SPECKLED BEAUTY.

TWELVE MONTHS OF POULTRY LIFE; AN INTERESTING CHICKEN-STORY FOR THE JUVENILES, BY MRS. AXTELL.

CONTINUED FROM P. 735.

Soon the bright summer wore away, and the yard was filled with chicks, big and little. Cold weather came on, and our coops were not very warm; and as mistress had poisoned the rats, she did not need to close the coops at night, so now we were often very chilly, especially when the cold wind blew, and rain beat in upon us, as our coops leaked badly.

Master Brown came one night and caught ever so many of us to sell, as he said we should all be sick from the exposure, as some were already dying of bowel trouble caused by the cold. Some said it was cholera, but it was all caused by taking cold.

Master Williams advised giving us sharp grit. Pounded crockery was good, he said; and he told us to put two tablespoonfuls of copperas into a pail of water for us, if many were sick; if not very sick, one spoonful to the pailful would do, removing all other water, so we should be compelled to drink the copperas water. Mistress said she had tried so many different things that she had almost come to believe nothing would do any good; but she did try the copperas, and it helped us right away. Then we were all gathered up, what were left of us, and put into a warm hen-house, as master Brown had built a new one, because he said we were fine stock, and cost too much to let die in cold weather for want of proper protection. He sold off the homely chicks, and kept only what master Williams pronounced perfect specimens. As I had but one foot, I should have thought I would have had to go; but I had been given to Clara, and I was pronounced perfect in all respects, except the loss of one foot.

The new poultry-house had large glass windows in the south that could be slid to one side in the summer time. The space was covered over with wire cloth, so that we might not break the glass; and when slid to one side it would not let rats and other vermin in. There were two doors, one in the south and one that opened into the old hen-house, that was not very warm. When our house was too warm, the door into the old house was opened, which prevented the cold winds from out of doors blowing directly upon us.

I wonder whether people know how thankful poultry are for dust baths in winter time. Well, every evening Clara came out with a large panful; and, after sweeping our floors, she took the shovel and threw ashes all around. This absorbed the moisture of the droppings, and made it easy to be swept next day. She kept a shallow box full for us to wallow in, or, to be more polite, to bathe in, for that is the way we kept ourselves clean and healthy.

We soon became very healthy in our warm sunny house; and with such good care as we were getting of late, through the influence of master Williams, we were a very happy lot of chickens. It was plain to be seen that mistress was proud of us, for we were pure-blooded, handsome chickens. I heard her tell a neighbor, who was lamenting that she had no good place to keep her chickens in winter, that she felt so bad for her chickens the winter before, that she lay awake at night, and cried to think of *their* sufferings, as many of them had frozen feet and bills, and frosted combs; and she told this neighbor that, if she would get pure-blooded chickens, her husband would feel so proud of them he would build them a nice warm house. That was what induced farmer Brown to build her a hen-house. She had asked him many times before to build one, but he had never thought it worth while to do so until she had gotten a nice flock of pure bloods.

Another trouble was coming upon us. Very many of us were taking sore throats. Mother Biddie said she was sure it was because master had made our perches so high that we could not fly up to them easily. As we were a heavy breed of chickens we flew up part way, and threw our heads over, and hung and struggled before we were willing to let go and drop down, to have to fly up and try it over again. Master had forgotten to put up ladders to hop up on. What would have been better still would be to put the roosts so low down that we could easily hop up on them without ladders.

Mistress said she did wonder what the matter was with us. As we wheezed and breathed hard, she felt of many of us; but as none had sore necks she believed it was the roosts, and she gave master no peace until she got them cut down and made lower. A few of us died, but the most of us got well; but mother Biddie was a big heavy hen, and it went hard with her. She fairly squealed one night when she breathed, and the next morning she lay dead under her perch.

Mistress felt very bad about mother Biddie's death, for she said she was such a nice hen. She was a good mother to her chickens, as mistress could put chicks of almost any age with her, and she would take them. She was not like another hen whose chick got hurt, and which was kept in the house a few days in a box. When it was returned, and fastened in the coop with her at night, she picked its skull bare. But it recovered, though they had to keep it in a box for a while. As it was a nice large chicken, mistress nailed some pieces of carpet in a box along the top of the box, and let the carpet hang loose. The chick would run around outdoors in daytime, and return to its brooder-box at night. Mistress kept several such brooder-boxes, so when the mother-hen left her chicks when they were too small they could be set in their coop, and the chicks would run into them at night and keep warm: and when the hens were inclined to stay with their chickens too long, mistress would take them away and shut them up a few days, and then they would soon go to laying again, and the chicks would be better off in the brooder than with her.

Master put a square tube, which he called a ventilator, in the middle of our house. The bottom nearly reached the floor, and the top came out at the roof. One night some little animal came into our house and killed three of us by jumping on our backs, and, grabbing us by our necks, sinking his teeth into our throats until we were dead. Next day, master said the doors and windows must be closed tight, as something was killing the chickens. The next night seven more of us were killed. I escaped; but, oh it was horrible to hear the other chickens squall and drop down on the floor, and to know they were being killed, and that my turn might come next, as the hen-house was so far from the house no one could hear us! When mistress Clara came out with our nice warm breakfast, how frightened she was to see so many of us lying around dead! She went to the house and told her mother that seven more were dead. Mistress came out with her, and they hunted long for holes, and fixed up very small ones, until she said that not even a mouse could get in. But that night the same little animal came gliding down the ventilator as usual. How his eyes did gleam, like stars in the moonlight! That night was the most horrible of any in all my life. He actually caught and killed fourteen of my brothers and sisters. In the morning master Brown came in and said, "Oh! this is too bad, to see so many of those nice large chickens dead — fourteen of them this time." He gathered them up and put them into his bushel basket, and it well nigh filled it full. Mistress nearly cried, she felt so bad — twenty-four killed in three nights. Master said he believed the animal came down the ventilator. He went immediately and tore it out, so none of us were killed by the weasel after that, as that was where he came in. I knew it all the time: but you see I am only a chicken, and can speak only "hen talk," or I would have told master. Master Williams said there were enough of us left for a hen-house of that size. There had been so many of us before, that, on warm nights when the doors and windows were closed, we could hardly get our breath. I am sure we should have been sick if they had not been so careful to sweep out our house nearly every evening; and after sweeping they threw coal ashes under the roosts. That caught the droppings, and made it easy to sweep.

We all learned to love little mistress Clara, as she was taking better care of us since her papa gave her that nice poultry-book and subscribed for a poultry-journal. As the weather was often very cold now, we very much enjoyed the nice warm breakfasts she so often brought us; but she generally gave us full grains of corn at night, as she said her book said that whole grains remain longer in the crop, and so we should not get so hungry for something to eat during the long winter nights. What we very much liked was the stews she sometimes fixed up for our dinner, made of meat and vegetables cooked together, and thickened with meal and oat flour, and seasoned with a little salt. Oh my! how we did lay eggs! It was enough to make anybody smile to see such nests full of fresh eggs, in January and February, when the price of eggs was high. We just cackled and cackled; and a happier lot of chickens you never saw as the warm sunshine poured in through the great windows. Little mistress said we seemed to say, when we cackled,—

Cut-cut, cut-at! cut-cut, cut-at!
  I lay three eggs every day;
And yet I have to go barefoot,
  Go barefoot.

And the old Rooster, Robinson Crusoe, said, "Sell your eggs and buy some shoes, and then you won't have to go barefoot."

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

ANOTHER PROPOSED HONEY AND APPLIANCE COMPANY.

Our attention has been called by several subscribers to the prospectus of a company which it is proposed to form under the title of "The Apiary Products and Appliances Supply Association, Limited," with a capital of 20,000 pounds in 1-pound shares. According to the document before us, "The company is formed for the purpose of purchasing and carrying on the business of Messrs. A. & H. Timberlake, honey and wax merchants." After the failure of former attempts to establish successful companies on the above lines, even when guided by practical men, this last attempt shows an amount of hopefulness on the part of the promoters in which we can not share, especially as, with the exception of Mr. Timberlake (as the manager), none of the directors, so far as we know, have had any knowledge of bees or their products. We therefore recommend that our correspondents make full inquiry before investing.

We have not been favored by the promoters with a copy of the prospectus, and it is only by favor of certain of our readers that any information regarding the proposed company reaches us. It is also noticeable that, although the prospectus contains a statement that a contract has been entered into between certain parties, no names are given, nor does the date of the contract referred to appear.—*British Bee Journal*, Sept. 15.

MORE OF THAT "WHAT LOOKS LIKE FOUL BROOD."

I see in GLEANINGS that you have that disease that looks much like foul brood. I have had the same experience with it. Last year I had several cases of it; and as I was looking among bees that belonged to the neighbors I found the same thing, but not so bad. I had one case that was very bad last year in the fore part of the season, and in about two months it disappeared, and I haven't seen it in that colony since. This year I had one case of it, but it is all gone now, and the colony is strong. I am sure it is not foul brood, for I am acquainted with that. I never could tell what the cause of this disease is. I never tried to cure it, and it always went away of itself. While it lasts it weakens the colony very fast; but when it disappears the colony soon builds up again. From what experience I have had with this disease I don't think it will spread among other colonies, or that it is very bad, except at the time they have it. E. H. TRUMPER.

Bankers, Mich., Sept. 26.

THE MINNESOTA STATE FAIR HONEY EXHIBIT.

We have just returned from the State Fair, and I want to tell you we had a grand exhibit—one that would be hard to beat in any of the States. Everybody who saw it said they never saw any thing so nice in the Eastern States or Canada. To get up such an exhibit right in the face of one of the poorest seasons that the State ever had, means energetic labor on the part of the managers. Our superintendent, J. P. West, labored with the bee-keepers of the State in season and out of season to persuade them to make an exhibit; and the bee-keepers of the State want a little space in GLEANINGS to thank him for the good work he did, as he did not get any other compensation. We had some photos taken of the exhibit. I will send you one. WM. H. BRIGHT.

Mazeppa, Minn., Sept. 24.

DR. MILLER'S ROSES; HOW TO RAISE THEM, ETC.

I have been interested in Dr. Miller's roses, and I should like to know how he grafts them. I wish he would please write a piece about it, and illustrate his manner, so that I could do so. I have succeeded in grafting apples, plums, and cherries; but as rose-twigs are small, does he practice limb grafting or budding?

My husband and family are much interested in GLEANINGS. I feel as if the sermons were worth the price of the book. They are so plain that we can understand and apply them every day of the week, and that is the kind of religion that does good in this sinful world.

I have lived on this farm over thirty years. We live one mile from, and in sight of, beautiful Canandaigua Lake; also in sight of the village of that name, which is famed in Indian legend as "Sleeping Beauty;" and, indeed, it is a beautiful village.

We were pleased with Ernest's writings about our State last year. We wish he might have stopped at our house. We could not have shown him a large apiary, but we could have refreshed him with food and water, and given him Godspeed on his journey. J. R. FISHER.

Rushville, N. Y.

[Thanks. We should have been very glad to call upon you had we known we were so near you. With regard to the roses, Dr. Miller is respectfully called upon to answer.]

NO REASON TO COMPLAIN.

I am happy to report, that, after all our spring losses and summer disappointments, bee-keepers in this section of country have no reason to complain, and long faces should be done away with, for the month of August filled many barrels with nice extracted honey. Many bee-keepers, who had invested largely in supplies, and seeing June and July pass by with bees in a starving condition, had almost been sinking in despair. The writer has secured, up to date, about 2500 lbs. of No. 1 extracted honey from 68 colonies, spring count, and nearly all colonies are supplied with sufficient stores for winter; and if Jack Frost does not visit us during September, quite a lot of nectar sweets will be realized, for bees are working finely on goldenrod and fall flowers; but those who worked their bees for comb honey missed it, for bees could not be induced to work in the sections.

STEPHEN ROESE.

Maiden Rock, Wis., Sept. 3.

WINE AS A BEVERAGE ON THE ISLANDS OF LAKE ERIE.

In reading over your Home talks in the last number as to boys and their search for beer, it reminds me of an investigation which I entered into on my recent and first and only visit to Put-in-Bay. I found wine, wine everywhere—every few feet—right out on the street and lawns, and indoors, and only one temperance place, and that a couple of tents, run under the care of the W. C. T. U. I went to those tents with a friend and called for lemonade, and was told that they had none. Inquiry showed that they were not allowed to sell any drink but coffee, tea, and water. Why? because, to sell such would interfere with the wine-trade! The W. C. T. U. could not rent a piece of ground if they should sell lemonade. Comment is unnecessary. On this, my first and only visit to Put-in-Bay, I could not help but arrive at the conclusion that it was a good place *to stay away from*, and to recommend others to do the same. I am told that the other islands have the same rule. Here is another fact: There is more wine sold on the different islands there as "native wine" than could possibly be raised on a third more area than they all combined contain. As nearly as I can make out, these are the facts.

Cleveland, O., Sept. 20. R. V. MURRAY.

[Well done, old friend. It is refreshing indeed to find that the man who makes the pictures for GLEANINGS is one among the little crowd who are hungering and thirsting after righteousness. It seems to me, friend Murray, that the W. C. T. U. needs a little lifting by some of the men-folks. As GLEANINGS goes almost everywhere nowadays, perhaps it may be the means of stirring up some good brother to come to their aid and to give them a little bit of ground on which to locate a lemonade-stand.]

A PROFUSION OF SMARTWEED.

The season has been a good one here so far as clover was concerned; but the bees were not gotten into shape before the honey crop, and, as a result, the supers are empty. Bees will winter well, for there has been the greatest profusion of smartweed bloom in ten years, almost all colonies laying up enough stores, and in some instances a little surplus.

Alexandria, Ind. E. E. Edwards.

My report for the past season is, 9000 lbs. from 100 colonies—a poor season in California.

Riverside, Cal., Aug. 12. H. E. Wilder.

RAMBLER.

What makes Rambler look so pleased? I see he has lost a tooth. Was it in climbing the mountains? Has he got a new hat? It looks like one, but he has the same trousers and umbrella. What's that he is holding in his hands? Oh, yes! a camera, and a book and pen to take the notes of travel. R. L. Rhodes.

Montville, O., Oct. 6.

Bees are working all the winter when not raining. Best report (authentic) last season, 640 lbs. from one colony. Honey, extracted, 6 to 9 cts.; comb, 12 to 16 cts.; wax, 22 to 24.

L. T. Chambers.

Melbourne, Australia, July 27.

NOTES OF TRAVEL

FROM A. I. ROOT.

THE ENCHANTED MOUNTAIN.

Long before we reached Maricopa (a station on the Southern Pacific Railroad where a short branch road strikes off into the desert to Tempe and Phœnix) I had fixed my eye on a strange and wonderful mountain away off in the east. It seemed to rise abruptly from the desert until it was well up in the clouds, and then there was a level space—a sort of "mesa" —on the top; and from near the center of this level space arose another smaller mountain, but it looked more like the turrets and battlements of some giant's castle than it did like the mountains; and this uppermost central peak was, of course, away up amid the clouds. As we struck off toward Tempe I felt sorry, for it seemed as if we were going away from this strange and grotesque mountain. But by and by the road changed; and as the mountain grew, and became larger and more imposing, I began to be greatly interested in it. By and by my curiosity would not permit me to keep still longer; and when a passenger informed me that the object of my attention was *Superstition Mountain*, I became as much excited as was the Yankee. You see, he had been asking a fellow-passenger a great many questions, because the latter had only one leg. The stranger finally turned to him and said:

"My good sir, I will tell you how I lost my leg if you will give me your promise not to ask me another question."

The Yankee readily gave the promise; but when he was told that the missing limb was "bit off" he probably felt a good deal as I did about the mountain. If I remember correctly, he did make answer something as follows:

"If I were not a man who *always* keeps his promises to the letter, I should feel very much like asking what sort of an animile it was that did the bitin'." Therefore I immediately ventured:

"Will you be so kind as to tell me, if you can, sir, *why* they call that wonderful mountain Superstition?"

"Well, I have never been there, but I have been told that, from time immemorial, the Indians refuse to go near it, much less to climb to its rocky heights. They give, as a reason, that strange noises are always heard around its base, and that those who have been bold enough to climb up, report that the noises increase as one goes up, and that strange flashes of fire flit from cliff to cliff. One who was more daring than all the rest kept on until he got up on to that turret that looks something like a winding stair, and there the thunderings and lightnings became so terrible that no mortal could stand it."

Of course, I was full of questions about Superstition Mountain when I reached my brother's; and I was greatly disgusted that they had all lived so many years right in plain sight of it, and not one of them had ever been so far as to get even to the base. In order to satisfy my inquiries they referred me to several personages about town, and by and by I became considerably acquainted with the minister, the doctor, one of the lawyers, and even a shoemaker who had been at least part way up the mountain. There were many different accounts of the wonderful noises, and of the Indians' superstition in regard to the strange peak. One informed me that the ruins of an ancient city were to be found away up on the summit. The shoemaker said there were cliff dwellings near there, for he had seen them; and an old ex-minister, who probably knew more about the strange surroundings of this weird country than almost anybody else, told me that Gen. J. C. Fremont, during the war with Mexico, had a regiment of drilled Mexicans and Indians. Once upon a time, to escape a fierce thunderstorm he ordered them into some of the numerous caves found in and about the mountain. They obeyed orders with fear and trembling, and an evident inclination to break away from authority. But Fremont was more than a match for savage superstition until a thunderbolt of startling vividness, followed by a fearful crash, shook the mountain to its very summit. This was too much for even the military drill of those children of the desert. First a small band broke away from authority. These, as soon as they dared, gave vent to the Indian yell of terror, and the whole regiment broke out into the drenching storm, and could never be marshaled together again.

Now, if my imagination in the above has supplied something which I could not exactly remember, I hope you will forgive me. Almost every one I invited to go with me to explore Superstition Mountain readily consented. Perhaps they were interested in my enthusiasm if not in the mountain; but just about as we had got the program finished, the women-folks set up a vigorous protest. I was an invalid, not yet accustomed to camping outdoors, even in that mild climate; and to go away off in the wilderness where we might suffer from a lack of food and water, or, possibly, be devoured by "wild beastes," was a thing not to be thought of. Besides, up around that turret it was all ice and snow. Yes, the snow was right before my eyes even while I declared I could not *live* if I did not investigate the caves and wonderful sights before going home. One after another the party backed out, and sadly and sorrowful-ly I was induced to give up my project until summertime, when it would be tolerably warm weather, even away up amid the clouds. However, Jess and I (that is what I call my brother) planned one day to drive the pony about ten or twelve miles in the direction of the mountain. Now, although it looked as if we might *walk* to its base in one afternoon, I was told that it was fifty miles away, and that it was fifty miles more uphill to reach the summit. As there was no beaten trail further than somewhere near the base, and none at all around and up the mountain, first one way and then another, to find an accessible path to the summit, we should have been obliged to carry provision and blankets, and feed for the horses for several days. Imagine how surprised, then, to find that, after we had gone ten or twelve miles toward it, the old mountain looked a good deal nearer than I expected, and ever so much more fascinating. Our good friend with whom we took our dinner, who had pushed an alfalfa ranch away off there alone by himself, declared that it was not more than 25 miles from where he lived. I was just reckless enough then to want to push off alone without provisions, water, or any thing else; but I knew it was not wisdom. But in the last few days I have been speculating as to whether my trusty wheel would not skim over the sands of the desert. If not, I want one made specially with a wide pneumatic tire—one that would operate something like snowshoes. Then you see I could make up my budget and spin off by myself and *explore* these hidden wonders, and get back to civilization before I — perished. I told my brother's folks when I bid good-by to Tempe, that I was leaving a great part of my *affections* there. When they began to look pleased, however, I told them that, much as I felt attached to that little family circle of relatives, to tell the plain truth said affections were hanging about old Superstition. Besides this mountain, the good old minister I have mentioned gave me a history of the wonderful country out toward Flagstaff, where we find the *real* Grand Canyon of the Colorado. There were cliffs there where you could look a mile straight down beneath your feet; and there is a natural bridge so large that there is a whole farm right on the top of it. Somebody said an old farmer had lived there all his life without knowing he lived on a bridge at all. But I think there must be a little exaggeration about it, for there is a hole down through in one place where you can look through and see the river below. Besides, there are springs there more wonderful than are to be found anywhere else on the face of the earth. A railroad is now in process of construction from Phœnix to Prescott, and then we can get somewhere without being in danger of perishing from want of food and drink. Now, if my ideas are wrong in regard to this wonderful Arizona region, perhaps some of our readers who live there will kindly straighten me out; but I do think it is too bad to live in a world so full of wonders, and find so many people who never knew any thing about it at all. It makes me think of the time of Columbus, when he was almost the only chap who had enthusiasm enough to explore the great unknown seas. By the way, do you know it is almost the 400th anniversary of the wonderful exploit of that intrepid adventurer? Oh! but I should just like to take Columbus by the hand and tell him how much I love and revere his name. If I just had *him* to help, but *wouldn't* we just explore old Superstition! Now, if you think I am telling yarns go and get your big map of Arizona, and see that great expanse of country covered by the title of "Superstition Mountains."

OURSELVES AND OUR NEIGHBORS.

In the sweat of thy face shalt thou eat bread, till thou return unto the ground.—Gen. 3 : 19.

The friends may remember that I had something on this text in a brief editorial in the last issue. But it is in a different line that I wish to speak just now. It is something that has been pressing itself on me for some time back, and yet I have neglected it and put it off. I have put it off because, if I take it up, I shall say something that will come nearer speaking ill of my neighbors than any thing, perhaps, I have said previously. It may seem so, and yet I wish to have it understood that I feel myself to blame; in fact, I try to believe that the larger part of the fault rests on "ourselves" instead of "our neighbors." I presume it is very likely that I have inherited a strong tendency to be uncharitable. My good old father was all his life demanding justice. He demanded, or, at least, he was inclined to demand, that his neighbors be just, honest, and fair; yes, and I fear he often felt inclined to demand that his neighbors be industrious and prudent; and as I grow older I find myself strongly inclined to get into the same rut. He worked hard for a living, and to bring up his large family; and when others about him did not work hard, and did not propose to do so, it was his natural disposition to wish to *make* them do so. If they transgressed the law, even in any little particular, his disposition was to demand that they pay the penalty. Some of you may say that this is right; but, dear friend, let me caution *you* about going out into the world demanding your full rights as you look at things, and full justice according to *your* point of view. You will be everlastingly in trouble. Let us now drop this part of it for just a moment.

For a good while back my dear wife has been saying that I give too much the bright side of things to my readers, especially in my efforts to show them how to get a living, and to make money. She insists that I have given too much prominence to the *pleasant* things about market-gardening and intensive gardening, and that I have not said enough about the *discouragements* and *difficulties;* and particularly has she urged that I should say more clearly and plainly than I have yet said, that it is next to impossible to make market-gardening, gardening under glass, or any of these kindred industries, profitable, where one expects to hire every thing done, and do little or nothing himself in the way of manual labor. And, come to think of it, the successful men who cultivate the soil, raise berries, or fruit of any kind, are almost always those who do the greater part of the work themselves, or with the help of their children, or, at any events, work right along *with* their men. There may be those who run a store or factory, and at the same time make it pay to raise crops entirely by the aid of hired help; but my impression is, that, if there are those who make a steady profit year after year in this way, they either have better "neighbors" than I have or than I have been able to find anywhere. May God help me from being uncharitable, or falling into a fault-finding and complaining spirit when I give to you in detail some of the difficulties in the way of making both ends meet with hired help. My impression is, that it is more difficult to make *farming* and *gardening* pay with hired help than it is to succeed in the various kinds of manufacturing business. If farming and gardening consisted in raising some *special* crop, as friend Terry does, a great part of the difficulties would disappear. But a good many people can *not* well raise *one* crop or special crops. They would get a great lot of perishable products on their hands, without a faculty or genius for disposing of them at a paying price. It is easy to *raise* crops—yes, great crops—that can not be disposed of for any thing like a decent price. Just now I presume I could pick several wagon-loads of wax beans; but I do not know of any place in the world where I could get even 25 cts. a bushel for the crop. A few months ago we got 15 cts. *a quart*, and did not have nearly enough to go around even then. Everybody is now tired of them: the same with turnips. I should be very glad indeed to get 20 cts. a bushel for my entire crop of turnips that are ready to harvest now; but I do not know where they could be sold. I have not the time nor brains to hunt up a market without having the effort cost me more than the turnips are worth. Of course, we retail them around town at a good deal more than that—say 15 cts. a peck, or 40 cts. if anybody wants a whole bushel. I asked the boys if they could sell any more if they offered them cheaper, and they said they did not think they could. It is the same way with summer squashes. In order to get them off the vines before they got too hard, we offered them at a penny apiece. The boys found a customer who wanted a nice squash; but when they told him he could have his "choice for a cent," he replied, "No, no, my friend! here is a nickel, and that surely is cheap enough. If I can't get the worth of a nickel out of it, it will be surprising." I mention this to show you some of the difficulties. But, on the other hand, we are getting very good prices indeed for our stuff as a rule—that is, if we don't raise *too much*. In fact, I would not ask for better prices, providing our markets were large enough so that they would take all that we happen to raise. The wax beans were planted with the hope that they might mature before frost, sufficiently for seed, and a large part of them have done so. We have had one pretty severe frost; but if we do not get any more for a week or ten days, my beans will be a paying crop. Summer squashes may also be utilized for seed to a certain extent. But this depends upon something that I am now coming to.

It used to be the fashion for boys to learn trades, but nowadays they don't do it. They just work for whoever offers them the most pay, first at one thing and then another; and the factories and other industries offer these untutored boys so much that I do not see how the farmer and gardener are going to pay such wages for untrained and unskilled help, and make both ends meet. Yes, there is one way in which the farmer or gardener might do it. He could take an untrained and unskilled boy right along *with* him; and while the boy is *by his side*, and sees all the time just what he is doing, if the boy really means well, and promises to be useful, he could earn his pay. But suppose you take the average boy, say fifteen or sixteen years old, and undertake to pay him 75 cents a day. I do not see how you could do it.

If my whole 20 acres could be planted to wax beans, and if that were the only crop we raised, I think I could teach the boy, without very much trouble, so he would know all about it, from getting the ground ready, to gathering the crop. I could teach him not to pick beans that were too thin and green, and also to avoid the other extreme and not let them get so old as to be tough. I could teach him not to set his basket down where nobody could find it until the contents were so wilted and dried up in the sun as to be worthless; and I could also teach him not to put into his basket a specked or spotted one, and not to get leaves, dirt, and rubbish; and I could make him understand that, to bring the best price, they must be as spotless and perfect as wax, for this is why they are called *wax* beans. But suppose, in order to get the two or three thousand dollars a year that our town of Medina will pay for garden products, I undertake to teach him just how to grow and handle *every* crop, all the way from asparagus, which heads the list of vegetables, clear down to turnips, which usually closes the catalogue list. The boy might be taught all the kinks and turns; but it would be like teaching him a trade, or taking him through college; and by the time he is taught so as to be an expert, somebody else would offer him 10 cents an hour, or 12½, or possibly 15 cents. Now, this sounds a little like complaining. It strikes me that it *is* a little on the other side that complaints are usually made. You may say, and very likely some of my boy readers will say, that wages are a good deal higher in our locality. I do not think they are, my friend. There are plenty wanting to work in our locality all the time. In fact, for years past I have been besieged, as I have told you, by those wanting places. A good many would offer to work in our locality for 50 cents a day; but these are the most expensive men and boys I have ever employed, with perhaps some few exceptions.

A good man or a good boy may sometimes start out to work for a very low price, believing that he will be able to make himself so appreciated that he will very soon receive higher pay. Oh how I do like to meet with such! But they are the exception and not the rule. There is more to be considered yet. This boy that you have, by months and perhaps years of painstaking, taught to be valuable, will, sooner or later, be taken from you suddenly. He may be sick; circumstances may call him away, even if somebody else does not offer him more pay. This is a world full of changes. Whoever goes into gardening or any other occupation must make up his mind to meet, and he must calculate upon, changes. The man who grows strawberries for a living, or whose strawberries make a part of his living, must be prepared to have his best man stop by sickness or accident in the height of the season. On this account it becomes almost necessary to keep on hand at the busy season a little more help than we really need. This is an expense, I know; but it is a little less expense than to see your crops spoil because you can not get hold of anybody who knows any thing about how to go to work to help you out of your crowd. There are pleasures and delights in raising berries, and in raising garden-stuff and crops. I have tasted them, and I know; but there are also trials and perplexities that must be met and borne. The curse that was pronounced upon Adam, is, in the language of our text, still in force—"In the sweat of thy face shalt thou eat bread;" and he who undertakes to escape or avoid it must pay the penalty in some way or other. The woman or man who proposes to go though this world without earning his bread by the sweat of his face, will, sooner or later, find difficulty and trouble. I have tried a great many kinds of business, and I have succeeded at least tolerably in several different kinds; but I have found the rule holds good all through. There *is* no excellence without great labor; and I think I would put especial emphasis on the word *great*. The class of people who think it is a fine thing or a grand thing to hire people and tell *them* what to do, instead of being obliged to do it himself, or to work for somebody else, are making a great mistake.

I thought, when I started out to write this, that I would tell you of some of the special trials that meet intensive agriculture. For instance, after you have got your crops all raised, if you do not keep a careful oversight you will be discouraged and disheartened every little while by finding something that is costing you more than you get for it, just in *gathering* and *selling* the crop. In the course of the year we sell a great many bunch onions. Perhaps there is no other one thing that sells so readily every day in the year, at a nickel a bunch, as green onions; but if you do not look sharp some boy will stop to play, or be so indolent about his work that it will cost you a nickel to pull a bunch of onions, peel, trim, and slip a rubber band over them. Boys who do this work usually get from three to five cents an hour; but I have known some of them (that seemed to mean well generally, too) who would manage in some way to put in an hour on one bunch of onions. You may say that this is the foreman's business, who looks after the boys. Well, the foreman was perhaps busy at something else or did not understand that he was to look after such things. The boy, too, needed teaching. His employer or some other kind friend should take him by the shoulder, and say, "Look here, my son, we get only a nickel for these bunches. You have been *so* long in getting *so many* ready for the market." If you do it in the right way he will straighten up and do four bunches where he formerly did one; and this sort of exhortation is needed all around. You may think it easy to go from one to another and do this sort of teaching. Perhaps one does not sweat very much in a *literal* sense in doing such teaching, but it wears on the nerves and vitality. It is like the work of teaching school. Somebody may say, "Why, Mr. Root, boys are not *fit* for such work as that. Set some good smart women at it—women who have had the care of a family, and know how to prepare stuff for the table, and to do it quick." Well, I have had a large experience with women of this very kind, and I know very well that this very boy's mother will sometimes bunch as many onions in an hour as the boy himself would in half a day. Perhaps she wouldn't cost more than *twice* what you pay the boy; but when she gets to be skillful and valuable help to you, she will want about 10 or 12½ cts. an hour. Other people, too, will find out that she is skillful and efficient, and the *money value* of every wage-worker, sooner or later, finds its level.

You may say that the illustrations I have given are only trifling matters, and that it is all a kind of five-cent trade, any way. True; but it is a cash-down trade; and it is sometimes better to have nickels, spot cash, than to sell crops for dollars that are not spot cash. And, by the way, let us find some of the difficulties where *more* capital and good *men* are employed. If you garden many acres you want a manure-spreader, a grain-drill, and other like expensive and to some extent complicated machinery. Can the average man be intrusted with such tools? I have owned two manure-spreaders. The first one was worn out and used up in a few years. This was because somebody or several "somebodies" were not careful. After the burning of our warehouse I purchased a new spreader—the best to be had, and picked one of my most careful men, and taught him how to use it. Very likely the first mistake came because the careful man was sick or off visiting, and somebody else had to be hastily instructed in the use of it. Every little while it would be run without proper oiling, unless I personally got out my pocket-knife and cleaned out the oil-holes, and made the oil go down to the bearings though the hole. Then I must go back to the store or office with my hands covered with black grease, and perhaps my clothes soiled. The new machine was, in three or four years, about as badly dilapidated as the old one, and I have groaned in anguish of spirit because mishaps and breakdowns occur with that manure-spreader so continually. Whenever we have a rainy day, the standing orders are for all hands to go into our large tool-house, clean up, oil, tighten up, and put the tools in order. If I am on hand when it rains, and can spare the time, we get a good deal done; but if I send somebody to give orders, even though it rains half a day or more, the next time we want to use a tool we are almost sure to have a big team and possibly a couple of men standing still until somebody brings a bolt or nut to replace one that is lost or broken. The history of our grain-drill, which we use for sowing the greater part of our seeds in market-gardening, is much the same. A good deal of the damage to our tools has been done by lending them. Some of the neighbors who hired them thought I was getting rich by charging them 25 or 50 cts. a day for the use of an expensive machine; but I am sure that what I received in that way has not paid for repairs. This is a dismal story, is it not? But the fault is largely my own. I have attempted so much that it has been impossible to look after it all. May God help *me* to reform. My neighbor *Terry* has a manure-spreader that has been used for a dozen years, with less than a dollar expended in repairs. Before he starts to use it he goes with his hired men and sees them oil it. Then he raises the wheels and turns them by hand, and the machine is never allowed to go out of the tool-shed until every wheel moves as free as air. Yesterday our manure-spreader was started, and I saw from a distance that the drive-wheel was *sliding* on the mellow ground. I hastened out into the lot, and found the reel that does the spreading could hardly be turned by hand. In my absence the machine had been left out in the rain. One of the boards had warped so as to press against the reel. Do you wonder we have breakdowns? Some of you may say you would not have such men around. Gently, my good friend. My men are good men; but the demands of our factory, and large business, call them from one thing to another, and into so many different lines of business, that it is next to impossible that they should do very much better than they do. Better undertake to do one thing, and do it well; *then* the sweat of your face will stand a better chance of bringing you your *bread*.

No matter how good your help may be, you have got to watch things and keep an eye on the minutes as well as the nickels. People who have *learned* how, and who can, if they have a mind to, work very rapidly, have a way of backsliding and degenerating, if the boss is not around. Now, I hope that my good friends who read this will excuse me if I seem to be complaining of my neighbors. I have known women who have brought up families, to go out into the fields to pick snap beans, and get the wrong variety—in fact, pick a great lot that were fit for nothing whatever. I have also known them to pick peas with pods about as thin as caseknives; and I have known men who are the *fathers* of families, to pick green corn before there was a kernel on the cob. Sometimes I would say, "Look here, my friend; how would *you* feel if somebody were to sell you some corn for dinner like that?" As I spoke I stripped down the husk. He did not reply at first; but finally, when urged, he said, with a smile, "I guess I should feel pretty mad." To those who pick the peas without any thing inside of the pods, after I had broken them open and shown the contents as above, the reply would be, "Well, I think I shouldn't like it very much."

In teaching people how to work, I often make a remark something like this: "My friend, the good book says that we must love our neighbors as ourselves. Now, if you would get pretty mad, or wouldn't like it very much if somebody were to sell you such peas or such corn or such snap beans, you must admit that you are not doing as you would be done by.* You say you did not *think*, or did not *mean* to harm anybody, and yet you have wronged me; and you *would* have wronged my customers (which would have been worse yet, so far as I am concerned), had I not happened around just in time to stop you." Such teaching and such exhortation help matters very much; but it must be done *over* and *over*. If you do not keep constantly in mind that John is off across the creek at work on the strawberries, and Henry is over the hill picking peas, and William in another direction sowing some seeds, and get around to all of them pretty quickly, you will have trouble and disaster.† If the person who is sowing the seed puts in too much you *may* have a job of thinning out that will cost almost what the crop is worth. If he does not put in enough seed, you must either transplant to fill up the vacant room, or you must let your rich, expensively fertilized ground lie idle—a part of it—through the height of the season. Our good friend J. W. Smith, of Green Bay, Wis., has about 40 acres in market-garden; and he, with the help of his boys, keeps busy from 50 to 75 hands, including women and children, in the height of the season. But he does not manage so as to have no waste or disaster either. Even during the brief hour that I went over his grounds, I saw several things that were going to ruin though neglect. In fact, one part of his wonderful plantation of currants came very near being eaten up by the swift-moving currant-worm. I wonder that his work does not wear him out more than it does.

"Well, Bro. Root, you are certainly going to give us a remedy for this state of affairs. You surely do not mean here in these Home talks to tell us of troubles and discouragements, and not suggest a way out." My dear friend, I should be very glad indeed to give you some encouragement. You know our country is just now having much trouble in discussing this very problem. The people who *work* think they do not have as much as they should have; and those who hire them—especially farmers—think they can not *stand* it to go on farming and pay as much as they have been paying. I wish it were possible for a poor weak faulty human being like myself to suggest a remedy that would be agreeable to all parties.‡ I have studied over the matter a good deal, and it has seemed to me that the remedy must come along the line of our text. We must *all* be willing to "sweat" harder, or, in other words, keep our minds more on our work; then we from the opposite extremes shall be able to meet each other—yes, meet and clasp hands as friends and neighbors, even though one of us does the *bossing* and the other the *work*. Possibly we may soon exchange places. In this busy world of ours we are, in reality, almost constantly changing places; but if we want to be happy, if we want to enjoy our work and receive God's full measure of blessing, let us work thankfully and uncomplainingly. Let us be good-natured and patient, even if the sweat should drop from the end of our noses and run down the face into the eyes, as I suggested to you in the last number. And as we work together in gathering the crops, may God the Father give us grace to say in our hearts as well as in our words, "Blessing and glory and wisdom and thanksgiving and honor and power and might be unto our *God* for ever and ever."

HIGH-PRESSURE GARDENING.

BY A. I. ROOT.

THE NEW CELERY CULTURE.

This is the title of a little book published by the Rural Publishing Co.; and, in fact, most of it has already been given through the columns of the *Rural New-Yorker*. The principal idea in this new celery culture is, in dispensing entirely with all banking up. The plants are placed so close together that, when they are fully grown, they cover the ground so as to do their own bleaching. Like the new onion culture and a good many other new things, it is not quite new after all. Peter Henderson, years ago, recommended planting celery a foot apart each way, with this very purpose in view. Robert Niven, however, the principal exponent of this plan, puts the plants only 7 inches apart each way. You see, it is an important point to get just the right distance. If the plants are too close they will crowd each other, and you will get only a spindling growth; but if too far apart they will not be sufficiently bleached. Of course, the ground must be tremendously rich and strong, and there must be no stint of water, if you would have good strong stalks of celery only 7 inches apart. My plan would be, and is, to use stable manure; but Mr. Niven, however, uses the Bowker celery-fertilizer. Now, I have never been able to get any benefit from chemical manures on celery. I am, however, at present, testing the matter. My celery-bed is oblong, and made as rich as it can well be made, with barnyard manure. After doing this I have used the celery-fertilizer on alternate squares. At present I can discover no effect whatever from it, but perhaps it is not yet time. Mr. Niven uses two tons of fertilizer per acre, and he has already succeeded in raising a crop of celery on a single acre that sold at the rate of *$10,000 per acre*—at least, so the *Rural New-Yorker* says. Perhaps I may state that we have been growing celery somewhat on this plan for years; that is, after the plants are taken from our seed-beds we have let the remaining ones grow, banking them up outside; and in places where the plants were thick enough there would be no banking at all. The celery, however, was never quite as white and crisp as that bleached with earth. A relative of mine, however, informs me that he has now five or six thousand White Plume raised on the

---

* The man and boy who sell stuff on the wagon will never make a blunder of this kind, you may be sure. They have seen customers so many times refuse to take them because they were unripe or overripe, that they have learned their lesson well; but it is not always possible or convenient to have the men who *sell* the stuff do the gathering.

† My wheel is proving a great help right here. I now go across the creek, or up by the windmill, and along the roads and paths wherever the men and boys are at work, with no laborious fatigue, and in a twinkling of time. It makes exhilarating pastime of what has been wearing me out—that is, when the ground is not too wet.

‡ One sure way of meeting these trials and difficulties forces itself almost constantly upon me. The father, with his own boys and girls, can meet the demands of the case—that is, if the family relations are such as they should be. The boys can be taught how to care for machinery, and they will have an interest in taking care of it that hired help seldom has or can have. I believe God intended that the family circle should be a partnership; and when we can see the boys, after they are married and have families of their own, still working side by side with the father, we get a glimpse of a happy solution of a great part of these troubles.

Niven plan, equal to any celery banked up. If this should be a success it will be a wonderful advance in celery-growing. We shall have reports, doubtless, before winter sets in, from a great many experimenters. The people at our Ohio Experiment Station have been for some years raising nice celery on a plan somewhat similar. The plants are a foot or more apart, and dirt is worked in between them. In order to get them out of the dirt you make a row of celery, say six feet wide, and then you have a road or alley six feet wide. The dirt needed is to be shoveled out of this road. The little book entitled "The New Celery Culture" also discusses other methods, and is, without question, worth the small price asked for it—20 cents—to any celery-grower. We can furnish it by mail at the above price.

OTHER NEW RURAL BOOKS.

The Rural Publishing Co. are giving us some quite valuable hand-books on rural matters, besides "The New Celery Culture," which I have already mentioned. A companion to this is "Chemicals and Clover," price 20 cts. Now, I should be very glad indeed to give this book a recommendation; but it makes me feel bad, and it *troubles* me exceedingly, to think that, on our soil, whether on low creek bottom or on upland, chemicals seem to have almost no effect whatever on our crops. I should very much prefer to use fertilizers than to get so much manure from the livery-stables, for then I could escape the great host of weed seeds that are sure to come with stable manure.

We have already given a notice of "How to Rid Buildings of Rats," etc. This "rat-book" is of especial value. The book is written in such a happy vein that almost every one who takes it up will read it through; and after they have read it they will, all their lives, be better prepared to fight rats and mice successfully. The price of the book is 20 cts.

"Spraying Crops" is another little book, by Clarence M. Weed. It seems to cover the whole ground (of course rather briefly) up to the present time, and the price is only 25 cts.

Another book is the "New Potato Culture." This is written with the especial view of raising potatoes by the use of chemical fertilizers, and, of course, like my good friend Terry, I can not understand how anybody can raise potatoes with chemicals alone—that is, judging from the experience we have had. When they talk about guano, that is all very clear and plain sailing, for that is animal manure; but the statements in regard to nitrate of soda and such like chemicals are, to me, a stumbling-block. Why don't such things produce any result whatever in any experiments that I make? The price of this book is 40 cts. in paper, or 75 cts. bound in cloth.

The next book is "The Horticulturist's Rule Book," written by Prof. Bailey. This is a very valuable reference-book indeed; in fact, it is wonderful to see how much real knowledge and information is given briefly in a few words, and it covers almost the whole ground of horticulture. The price is 60 cts. in paper covers, or $1.00 bound.

We can forward any of the books mentioned above, on receipt of the price given. I would especially recommend the "New Celery Culture." This will be particularly valuable to those who grow only a little celery in their own garden, for by this new process we can get almost a wagonload of celery on a piece of ground not much bigger than the wagon-box itself; but, oh dear me! you have got to give it *manure* and *water*. Celery is one of the few plants that are so accommodating as to grow almost as well (or sometimes it seems even better) in the shade of buildings. On this account many people can have a little celery-garden where they could not have a garden of any sort very well.

THE OHIO STATE UNIVERSITY FARM.

Inasmuch as we have had frequent contributions from our Ohio State Experiment Farm, and have also published the results of many of their experiments, we think it quite likely our readers will be interested in the following announcement:

> The management of the Ohio State University Farm, which has been conducted by the Ohio Agricultural Experiment Station during the past five years, has been again undertaken by the Board of Trustees of the University. The farm has been placed in the direct charge of the professor of agriculture, while the horticultural work is in the hands of the professor of horticulture. Mr. Franklin P. Stump, a recent graduate of the Course in Agriculture, has been appointed Foreman of the Farm. Mr. W. S. Turner, formerly with the horticultural department of the Experiment Station, has been appointed Foreman of the Gardens.
>
> The re-occupation of these grounds by the University will enable the instructors of the Departments of Agriculture and Horticulture to use the farm and gardens for class illustration and instruction, and thus make possible a considerable enlargement of the practical work in agriculture and horticulture. It is not the purpose of these departments to make money, but to make men.
>
> A large portion of the work on the farm, and in the gardens and orchards, is done by students, preference being given to those in the School of Agriculture. During the past week 39 students have been on the pay-roll of the Departments of Agriculture and Horticulture. Five other men were employed, three of them for less than three days.
>
> The members of the faculty composing the Committee on Agriculture will undertake such experimental work as their time and the funds at their disposal will allow. Thos. F. Hunt.

I would call particular attention to one sentence in the above: "It is not the purpose of these departments to make *money*, but to make *men*;" and in these days when so much is said about bribery and corruption generally in public places, it is pleasant to know that no such charge has been made against the students and managers of our various experiment stations belonging to the different States. In some cases they have been accused of stupidity, but never, to my knowledge, of dishonesty; and when it comes to the former, the man in these days who has not had occasion again and again to call *himself* stupid is surely not a progressive man. The stations are, by their tests, giving us a glimpse, for almost the first time in the history of the world, of the real stupidity and superstition the world has for ages been groaning under—that is, the agricultural world. I have often wished that other departments of science and industry might be weighed in the balance in about the same way that our agricultural colleges are now weighing and testing every thing in their line.

THE BORDEAUX MIXTURE FOR QUINCE-TREES.

Some five or six years ago I purchased fifty quince-trees, and have been trying ever since to get some quinces. They are on very rich ground, and, we thought, had the best of care; yet the fruit was so knotty and gnarly, and the foliage looked so spotted and twisted, that I began to accuse the friend who sold me the trees of having given me some inferior kinds. In fact, Mrs. Root would scarcely consent to waste her time in cutting over any quinces of *our own raising*. Last spring I sprayed them three times with the Bordeaux mixture; and notwithstanding almost every time the solution was washed off right away by drenching rains, the trees have put on a better appearance than ever before, and I have succeeded in showing some of the finest quinces that anybody ever saw around here. In fact, they were large, round, smooth, and fair. Somebody said they used to see such quinces years ago when the country was new, but not of late years. I think there can be no mistake but that it was due to the copper solution, for we have never before had even a single quince that was worth carrying home.

AN EVER-BEARING BLACKCAP RASPBERRY.

I think it was a year ago last February that some good friend among our readers sent me a little raspberry-plant, with an injunction to take good care of it, saying it would show me something wonderful. He further added, "It will bear you nice berries this year." We put it in the greenhouse, and it took hold and grew amazingly. But I put it in the open air almost too soon, and it got a backset that it scarcely recovered from during the whole of last season. This year, however, it started again and grew as it did in the greenhouse. A little before other blackcap raspberries were bearing, it commenced bearing on *new wood of this season's growth*, and it has been blossoming and bearing ever since, and gave us a double handful of most luscious berries on the 25th of September. The berries were as large as any blackcaps, and I should say they were the most luscious of raspberries. We have failed, so it seems, in getting ever-bearing strawberries; but we have an ever-bearing raspberry that, so far as my experience goes with a single plant, fills the bill completely. So far it has not seemed to be affected with rust or blight, nor any thing of the sort; and the funny thing about it is, that the berries grow along the ends of the new wood. Will the kind friend who sent it tell us its name? and if he has plants for sale, he can probably fill orders. A. I. R.

GLEANINGS IN BEE CULTURE

A Journal Devoted to Bees and Honey and Home Interests.
Illustrated Semi-Monthly
36 Pages 7×10
$1.00 Per Year.

The meek shall inherit the earth, and shall delight themselves in the abundance of peace. PSALM 37 : 11.

Look out for Rambler's article in next issue. It is rich in experience.

Oct. 6 we sent to Frank Van Allen, Medical Missionary, Madna, India, $34.80, which has been contributed by our subscribers for the famine sufferers of that country.

The last *Canadian Bee Journal* contains a very interesting picture of the apiary of F. A. Gemmill, Stratford, Ont. Mr. Gemmill and his family sit in the foreground, and the whole view shows a well-regulated apiary with all the best modern appliances.

We notice, in the *Canadian Bee Journal*, editorials signed "Assistant Editor." It would give us considerable satisfaction to know who that individual is—not that we wish to pry into the private affairs of our esteemed cotemporary, but it is pleasant to know who is talking.

While we are receiving, as usual, some discontinuances in subscription, the great majority in renewing, say, "Don't stop GLEANINGS. I want it as long as I live." Another that has just come to hand, says, "Keep on sending GLEANINGS or I'll puncture your pneumatic." Sometimes we feel as if we should like to sit down and phonograph thanks to all; but this is impracticable, and we hope our kind friends will understand that all this is thoroughly appreciated.

The *American Bee Journal* has not only been renewing its youth by infusing into its editorial veins new and younger blood, but now it beams forth in a new dress, or, more exactly, a new cover design, and here and there through its pages novel and appropriate department headings. Even though the "old reliable" has lately exchanged ownership, it is bound somehow to show the delightful impress of a *new* man, be he old or young.

The Chautauqua literary course has been such a marked success—a scheme whereby old and young who, for various reasons, can not leave home, can take a systematic course of study for a period of three or four years, pass examination and receive a diploma, that the Pennsylvania State College has inaugurated a Chautauqua course in agriculture. There are many farmers' sons who will be glad to take up such a course, and we take pleasure in calling attention to it. For full particulars address H. J. Waters, B. A. S., State College, Center Co., Pa.

Friend Alley, of the *Apiculturist*, seems to take it greatly to heart because we can not declare that his (Alley's) hiver is better than Pratt's. As we understand automatic hivers, and the objects sought, we can not but regard the Pratt as superior and better, both as to its cheapness and general operation. The grounds of our preference have already been given before, as well as incidentally in this issue. Only time can decide regarding the relative merits of any hiver, or whether or not they will ever be regarded as a permanent success. By the way, there are several things in the last *Apiculturist* that are — well, unjust and almost unkind toward not only ourselves but others. If they had come from any one but friend Alley we should be "mad."

With this issue the Rev. L. L. Langstroth begins a series of continued articles, giving in detail his autobiography—his early boyhood, experiences, and tendencies; short sketches of his college life, how he became interested in the study of bees, the circumstances which led to his invention that revolutionized bee-keeping, with here and there interesting reminiscences, charmingly told, of noted bee-keepers of the early days. These articles will continue through this year and part of next. The whole matter has been committed to manuscript, so that, in the event of a relapse of Mr. L.'s old head trouble barring him from further literary work, the articles will appear just the same. Some fine and expensive engravings have been prepared; and these, with the interesting subject-matter — apicultural history that came well nigh never being told—will make a valuable addition to our bee-lore. Be sure not to miss the reading of these articles through the entire series.

THE BURNING OF A BEE-SUPPLY ESTABLISHMENT.

We regret to announce that the bee-hive factory of J. W. Bittenbender, Knoxville, Ia., was burned to the ground a few days ago. Mr. B. had just put in a new boiler and engine, and it was while the former was fired up for the first time that the fatal spark from the stack took its flight through the air and set fire to the roof, and then to the whole structure, and part of the lumber-yard went up in smoke. There was no insurance, and the loss was heavy. The insurance had been canceled only sixteen days previously, the company at the time rejecting the risk, probably because it was too great, and Mr.

B. was not able to get insurance in any other companies. He was fortunate, however, in saving most of the machinery, amounting to about $1000.

While he would have carried insurance if he could have done so, the lesson comes to all of us to have our property in such shape that insurance men by the score will be willing to protect it at a moderate rate. That is the case with all the buildings here at the Home of the Honey-bees. With one exception they are all built of brick, and protected by automatic sprinklers; and the result is, we get a comparatively low rate from the best of companies. No manufacturing building or warehouse should be built without a metal roof; and the boiler-room should be carefully isolated from the rest of the plant. Ours has double brick fire-walls between each of the buildings, with metallic doors in each wall. It costs but little more to make every thing *comparatively* safe from the ravages of fire. It *costs* a little more —nay, verily, it is really *cheaper* in the end, as friend Bittenbender has learned by dear experience. He informs us he will rebuild at once of brick, and no doubt will be ready for next season's trade as usual.

THE SIMPLEST METHOD OF TRANSFERRING; HOW TO EXTRACT HONEY FROM OLD COMBS WITHOUT AN EXTRACTOR.

Along in the early part of last summer we purchased some twelve or fifteen colonies that we really did not want, but took them because we had partially agreed to do so. The reason that we did not really want them was because the combs were built in loose frames, said frames having been spaced so unequally that the combs were decidedly crooked, to say nothing of being bulged out of all decent proportions. The bees purchased were placed at the out-yard, and the boys were instructed to select one of the best combs of each colony containing unsealed larvæ, and place it in a new hive, together with a full complement of Hoffman frames of wired foundation. Another hive with the old combs was placed on top with a perforated zinc honey-board between. The bees and the queen were then shaken off in front of the entrance, and allowed to crawl in. This plan was pursued with all the colonies. As the queen could not go above, of course no more eggs were laid in the old combs. In two weeks' time we went down and found that the frames of foundation below were being drawn out, particularly next to the frame of brood of old comb. In the mean time the young bees in the upper story were hatching out and coming below to take care of the young larvæ in the lower hive. In about a month's time the bees had taken up their quarters more or less below, while the upper combs, crooked and undesirable, were emptied of brood, and filled, to a greater or less extent, with honey. The drone brood (and there was a good deal of it) was uncapped at the time the hives were changed. The honey season came on rather before we expected it in the out-yard; and the result was, that most of the crooked combs were filled with honey. These we expected to extract, and melt up the old comb; but circumstances so transpired that we did not; and finally, toward the end of the season, we took off such combs and placed them in a stack of Dovetailed hives piled six or eight high. The entrance at the bottom hive was contracted so that only about two bees could get out or in at a time. Virtually we allowed the bees to rob the honey out; but it was so slow an operation that it made no commotion in the apiary.

With little or no labor we had the bees all transferred on Hoffman frames, filled with nice beautiful worker comb made from foundation on horizontal wires; and all that remained was a lot of crooked combs which were soon converted into wax, the home-made frame stuff making excellent firewood for the boiler-furnace.

Now, there is nothing particularly new in any of this. The plan of transferring is simply a modification of Heddon's short way, as mentioned in the A B C book. The scheme of emptying the honey out of old crooked combs was nothing more nor less than what was described by Dr. Miller some two or three years ago. It works so well that we shall never again leave a lot of combs stored here and there with a little honey in them to tempt robbers.

IMPORTED ITALIAN QUEENS QUARANTINED; DIFFICULTIES IN SENDING QUEENS OUT OF THE UNITED STATES.

The imported Italian queens that were ordered from Italy about the middle of August, although we have been notified that they were shipped upon the receipt of the order, have failed to come to hand. Queens that were sent by mail on the same date from Italy, all came through dead, including all attendants. The rigid quarantine that has been maintained recently, necessitating the fumigation of all mail matter, explains why the queens came dead; but why the *delay* of fifty that are to come by express? We have notified our receiving agents at New York of the expected arrival of the queens, and asked them to instruct the quarantine officers that they must not be fumigated the same as other matter. We are afraid that those officers, not knowing what to do, have held them, and, of course, by this time all are dead. We have a great many orders booked for imported queens; and we make this statement so that not only those who have placed orders with us, but those who intend to do so, will understand the situation. It is true, the queens may come, and come through alive, but now it is exceedingly doubtful,

By the way, we have had no success of late in sending queens to Australia or to the islands of the sea. Either the cages failed to go through at all, or else when they did the queens were all dead. In some of the cases the quarantine officers are responsible; in others, it is nothing more nor less than official bullheadedness on the part of the postal authorities in foreign countries. Just as we were succeeding nicely in sending queens to all parts of the world, those very countries where we desired most to send the queens began to reject them. We have been sending them out up until within a few days, but we think we shall have to refuse to do so, for this year at least, in justice to ourselves and customers, until the quarantine and official bullheadedness are adjusted in better shape. We do not complain at the quarantine on account of cholera, but we do feel justified in using pretty strong language when official red tape interferes with the interests of the people.

Later.—The United States Official Postal Guide for September contains the following:

POSTOFFICE DEPARTMENT,
OFFICE OF FOREIGN MAILS,
WASHINGTON, D. C., Sept. 7, 1892.

The International Bureau of the Universal Postal Union, at Berne, Switzerland, has officially informed this Department that the Postal Administration of the Colonies of South Australia, West Australia, and Victoria give circulation in their mails to live bees. Consequently, live bees will be admitted to the mails hereafter dispatched from this country for South Australia, West Australia, and Victoria, provided they are packed in exact accordance with the conditions prescribed in paragraphs "i" and "j," Note

14, page 905 of the United States Official Postal Guide for January, 1892.

By order of the Postmaster-General.

N. M. Brooks,
Superintendent of Foreign Mails.

We notice that New Zealand and New South Wales are not mentioned—two provinces to which we have sent more queens than to any other in Australia. We had hoped that these might be included when the ruling came out.

The paragraphs "i" and "j" refer particularly to the size of the queen-cages; namely, 5x2x1½, with wire cloth and a movable wooden lid. The rates of postage to the provinces mentioned will be 1 cent for 2 ounces. This is a great reduction from letter postage. Until all danger from quarantine disinfection is over we would not even send queens to the provinces mentioned in the fine print above.

FACILITIES?

Look where you will, there's no bicycle plant so grandly complete as the one devoted exclusively to the manufacture of Victor Bicycles.

For years the work has gone on—and still at it—of making a model home for the best bicycles the world ever saw.

No other bicycle plant compares with this one, as no other bicycle compares with the Victor—or is ever likely to.

Victor catalog for the asking.

THAT'S IT.

SPECIAL NOTICES.

Until further notice we will pay 5 cts. each for GLEANINGS for May 1, 1890. Remember, don't make a mistake in the number or year.

PRICES OF DIFFERENT FARM PRODUCTS.

In our locality, about 75 cents seems to be what farmers are getting per bushel for a good many things. Nice apples bring 75 cents; ditto onions; ditto potatoes; and I think very nice wheat would bring about the same; but perhaps more sales are made for about 70 cents. These prices are for first class. Of course, that is not very much for wheat; but for potatoes, onions, and apples, the prices seem to be pretty fair. A good many apples that are small or gnarly sell as low as 60 or even 50 cents; but where they are carefully picked, good sized, smooth and sound, I think there is no trouble in getting the above figure. Clover seed of all kinds is away up; and I have been wondering why bee-men do not make a practice of raising more alsike. I am told it is not affected by the midge or any of the enemies of the common red clover.

U. S. OFFICIAL POSTAL GUIDE.

This is a book of almost 1000 pages, 5¼x7¾, with monthly supplements of about 40 pages. It is published by authority of the P. O. Department, and contains an alphabetical list of all postoffices in the U. S., with county and State, a list by States, a list by States and counties, showing the money-order offices, domestic and international, also rates of postage, synopsis of postal laws, rulings of the department, information relating to postal matters, and general regulations respecting foreign mails. It is a book that ought to be in every business office that has much correspondence. The regular price in paper covers is $2.00; in cloth, $2.50, including supplements from time subscription is received till July, '93. The large volume is mailed early in January; but subscriptions should be sent in before that time. We are able to club the paper edition with GLEANINGS one year for $2.40, or the cloth-bound edition for $2.70.

MORE BOOKS DAMAGED BY WATER.

We have some more damaged books to offer. One of our water-tanks for fire protection is situated in a tower above the vault in which we keep most of our books. This tank got to leaking; and the water, working through the walls, has made a damp mold on some of the books. We offer the Christian's Secret, paper bound, at 10c, or by mail for 15c. We have also 15 or 20 copies of Quinby's New Bee-keeping, in cloth and gilt, that are molded on the front or back edge so as to disfigure them somewhat, the damage being almost entirely on the cover. This book sells new at $1.50, postpaid, or $1.40 with other goods. We offer these damaged ones at 75c each; by mail, 85c. Some that are damaged on the back edge have weakened the back so they will not hold together very long. If handled carefully they will hold together to read and lay by for reference. We offer these for 50c postpaid. We have also several thousand of the Abbott lithograph 12-color labels, slightly damaged—so little, however, that you will hardly detect it. We will sell these at $1.00 per 1000.

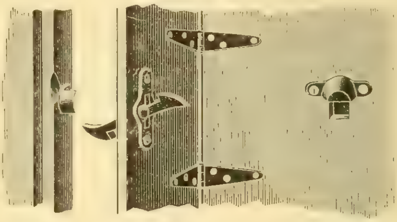
CARLOAD OF COMB HONEY.

We have on the way a carload of fine alfalfa comb honey from Reno, Nevada, to arrive within a few days. This comes from the same man, W. K Ball, who sent us such fine honey two years ago. There is no better honey produced anywhere than the alfalfa honey of Nevada and Colorado. It is very thick, light-colored, mild, and of very fine flavor. It is all in 1-lb. sections, produced with separators; is choice white, and packed mostly in 24-lb. cases, glassed one side. We offer it at the following low prices, and anticipate that it will go rapidly at this rate:

In lots of 1, 2, or 3 cases, 18c per lb.
In lots of 4 to 8 cases, 17½c per lb.
In full crates of 9 cases each, 17c per lb.
5 full crates, or 45 cases, 16½c per lb.

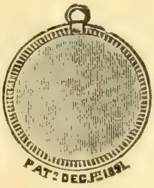
Since we have been receiving and shipping comb honey put up to ship by freight, several cases packed in a crate, with handles, we have not lost a pound by breakage, and we don't remember to have had any damage reported from customers to whom we have shipped, while we used to be bothered a good deal by breakage. We mention this that none may be deterred from ordering because of fear of breakage in shipping. Single cases by express are very often broken; but crates of several cases by freight, rarely if ever.

THE O. K. LATCH.



Stop that door from slamming. You can not do it more easily than by attaching one of the latches shown above. It will hold the door shut or open. It is intended for doors on all kinds of outbuildings, barn, stable, woodshed, honey-house, or any building that has a door that is liable to slam in the wind. The latch catches automatically either way when the door is opened or shut. It works so nicely that every one who sees it wants one. They are retailed from hardware stores at 25 cents each. They are made in this county, and we are allowed to make an introduction price of 15 cents each, $1.50 per dozen; by mail, 8c each extra.

AUGITE STOVE-MAT.



How much of domestic happiness is marred because the dishes prepared for dinner are scorched or burned! How annoying to have something boil over on the stove, as it is likely to do sometimes with the most vigilant watchfulness. All these troubles can be avoided by using the stove-mat shown herewith. We were somewhat skeptical about it till we tried it in our home, and now we are convinced that there is nothing that can lay a better claim to the term "a household necessity." The mat is made of asbestos, bound with sheet steel, crumpled around the edge, 9½ inches in diameter, and is indestructible. Though it is almost as soft as felt, it will not burn. You can place it directly on the blaze of a gasoline-stove, over the gas-jet, in the fireplace, or on the stove, and it will prevent burning of all kinds of food that ordinarily require stirring. No stirring is required for oatmeal, milk, rice, custards, blanc mange, jellies, butters, catsups, apple sauce, etc. In fact, nothing will burn on it. Coffee will not boil over if the pot is on the mat; bread toasts nicely on it. Try it and be convinced. For the nursery there is nothing equal to heat the milk and food for the baby. If a grate fire, lay the mat on the open fire. If the mat becomes soiled, do not wash or scrape, but turn the soiled part next to fire, and burn until clean. The mat regularly retails for 25 cts. We will furnish them at 20 cts. each; $2.00 per doz. By mail, 6 cts. each extra, or 65 cts. per doz. We will give one free postpaid for a new subscription to GLEANINGS, with your own renewal and $2.00.

SECOND-HAND FOUNDATION-MILLS.

We have the following list of second-hand foundation machines which have accumulated during the past few months, some in exchange for new machines, others from those who have decided to buy what foundation they use. We give as fair a description as we can of these machines, with the price at which we will sell. We can furnish samples from any of the machines to intending purchasers.

One 6-inch hex., No. N, used a short time in our wax-room; in good order; makes fdn. 10 or 11 feet to the lb. Price $10.00.

One 6-inch hex., No. M, extra-thin mill, in splendid order. Price $10.00.

One 6-inch hex., No. K, thin surplus mill, in good order. Price $9.00.

One 10-inch, round cell, No. L, in good order for light brood fdn. Price $14.00.

One 10-inch, round cell, No. I, for light or medium fdn.; in good order. Price $14.00.

One 10-inch, round cell, No. E, old-style frame; made some years ago, but used scarcely any, and in good order. Price $14.00.

One 10-inch, round cell, No. C, old-style frame; in fair order. Price $12.00.

One 12-inch, round cell, No. D, for heavy brood fdn.; roll, same size as 10-inch, only 2 inches longer; one of the original Washburn mills, in fair order. Price $15.00.

One 12-inch Dunham mill for heavy brood fdn.; not so good as the above, but in fair order; will sell for $12.00.

CHOICE WHITE EXTRACTED HONEY WANTED.

We are sold out of extracted honey, and have a good demand. Those having it for sale will confer a favor by submitting a sample. Tell how much you have, how it is put up, and what you want for it.

KIND WORDS FROM OUR CUSTOMERS.

HONEST, EVEN IF CHOLERA DOES COME.

Mr. Root:—You will find inclosed $20.00 to apply on my account. This is the best I can possibly do now. If I survive the cholera I will pay you the remainder. If I die, my wife, who is honest, will pay you out of $3000 life insurance.

Phœnix, Ariz., Sept. 9. JOHN B. HOOVER.

I have just returned from the State Fair, where I took two first premiums on comb honey—first on display and first on best 20 lbs., quality and manner of putting up for market considered. I used your 12-lb. cases and those honey-labels you sent me. The labels were considered very neat and pretty. One case was purchased to go to the World's Fair.

Harrison, Minn., Sept. 15. N. P. ASPINWALL.

I have half an acre in a vegetable and fruit garden, and read with great interest and profit your "high-pressure garden" department in GLEANINGS. It is the best, most interesting, and useful publication I ever read. I am going to try your plan of gardening under glass this coming season, so far as I am able to get the sash. I have already one strip of rye up, and am going to plant more to-morrow. Thanks to GLEANINGS for the suggestion.

Nashville, Tenn., Sept. 16. A. R. GRAY.

HEALING THE SICK, ETC.

Never mind Finch's rebuke. He failed to realize that prices are generally competitive, and set by the world. When you were talking about prayer, and healing the sick, why did you not give God's complete plan, as found in James 5: 14, 15? It is a direct command, and a direct promise, without an exception. The Lord shall raise him up, right away from his sick-bed. We know he will raise him at the resurrection; but *that* is promised *before*. Then it is a complete forgiving of sins. That alone is a great gain, and with the anointing, why can't we take God's plans? Will you please consider this?

Pottstown, Pa., Sept. 4. W. W. KULP.

A KIND WORD INDEED, AND WITH A MORAL TO IT.

Friend Root:—I received your letter of June 11, 1892, containing money order for beeswax I sent you. You give me more than the market price, saying it was for its good quality. This was pleasing to me, and exceedingly gratifying to know you were pleased with the wax. Thanks for your generosity. I admire your prompt, honorable, and careful way of doing business. As I held your statement for the beeswax in my hand, contemplating the accurate, clear-cut figures, and the handwriting (permit me here to give your lady clerk much credit), I said to my wife, "This explains why some people succeed when others fail." I am growing old, and, according to human events, will soon have to quit business. Our business relations have been long and pleasant to me, and I hope they have been to you. May your life's sun set in a clear sky.

Spring Mill, O., June 15. J. W. NIMAN

THE WATER-CURE TRACTS.

I will again avail myself of your offer to send water-cure tracts, such as you sent me free of cost some time ago. We have had a case of inflammation of the bowels in this village, which was pronounced by three prominent physicians as incurable the patient had to die, and that inside of 24 hours. I began to give him the injections according to directions, as I have taken them myself for two or three years, and the patient immediately felt relieved, and in three days resumed his work. The result was a sensation in the village, and many applications for tracts. As I am out of them I will rely on your kindness to forward me 200 more of them.

Taftville, Ct., Aug. 24. P. A. REEVES.

A KIND WORD IN REAL EARNEST.

Bro. Root: I am a constant reader of GLEANINGS, and I have greatly enjoyed reading the articles under the head of "Ourselves and Our Neighbors." In the July 1st issue is one of those articles that touched the most delicate cords of my heart, and awakened the deepest sympathies, and touched the tenderest emotions of my soul and my nature. My dear old brother, you have struck the right string this time, and it gives "no uncertain sound," but echoes the voice of God and his Christ in his holy word. Continue in this line; and may God give you faith and utterance. You may speak and write all the rest of your days on this text, and not exhaust it, for it comprehends and opens up the entire field. I have always believed, and still believe, that adultery and its twin sister and couplet, idolatry, were the great sins of men and of nations; that all other sins (except, perhaps, the sin against the Holy Ghost) were only collaterals. O my brother! let us look around us. I fully indorse the sentiment, "The sooner we believe in Satan, exactly as we are taught of him in God's holy word, the better for humanity;" knowing him, let us watch him, and study his operations with individuals, with church, and with state. M. W. C. FRAZIER.

Carrizo Springs, Texas, July 6.

IS THE BOOK OF JOB TO BE CONSIDERED A PARABLE OR A REALITY?

Mr. Root:—I often read with much interest your lay sermons in GLEANINGS, and sometimes find in them ideas worth appropriating for my own services. Oftener, perhaps, they serve me by their suggestiveness. But I do not quite like the idea of "taking the book of Job exactly as we take the parable of the prodigal son." My objection is, that other portions of Scripture seem to assume clearly that Job was a real man, and his trials a reality. For me and for many others the force of the lessons which you draw from the book is much reduced if the book is to be counted a fiction. We read in Ezekiel 14:14, "Though these three men, Noah, Daniel, and Job, were in it, they should deliver but their own souls," etc. If Job were a fictitious character, this would be much like grouping together Dr. Livingston, Mr. Stanley, and Robinson Crusoe. Again, in James 5:11, we read: "Ye have heard of the patience of Job, and have seen the end of the Lord; that the Lord is very pitiful and of tender mercy." Here is no hint that the patience of Job was less real than the Lord's pity and tender mercy. In fact, if the book of Job is only a parable there was no exercise of the Lord's compassion. Such are the views of at least one interested reader, and one of his reasons for the same.

Lincoln, Tenn., July 9. DAVID STRANG.

[Many thanks, dear friend Strang, for the additional light you give us on the matter; and I must confess to being so poor a Bible reader that I had never noticed either of the quotations you make. I accept the force of your reasoning, and thank you for it. Perhaps I might say that I received my suggestion, that Job might be only a parable, from one of the clergy; and, come to think of it, I believe he only stated that some theologians were inclined to accept Job as a sort of parable. Your position certainly does not lessen the force of the lessons taught in this wonderful book. Come to think of it again, it seems hardly likely that the personal wealth, as well as the names of the children of a purely fictitious person, would be given in the Bible. In the case of the prodigal son, the characters are evidently all imaginary, as nothing but the lesson of forgiveness is taught; but the book of Job is, to a great extent, the history of that man.]

5 Per Cent Discount On All Goods

Listed from pages 10 to 30 of our price list, which are ordered between now and Dec. 1st, for next season's use. This does not apply to goods on other pages, except those mentioned. **A special reduction of 20 cents on each two-story chaff hive,** ordered for a limited time. The quantity and early-order discounts to apply also. Special prices quoted on sections in lots of 2000 and upward. Name the quantity and size when you write. We guarantee as good a quality for the price as you can obtain anywhere. Dealers should not fail to write us before making contracts for another season's supply. We offer special inducements.

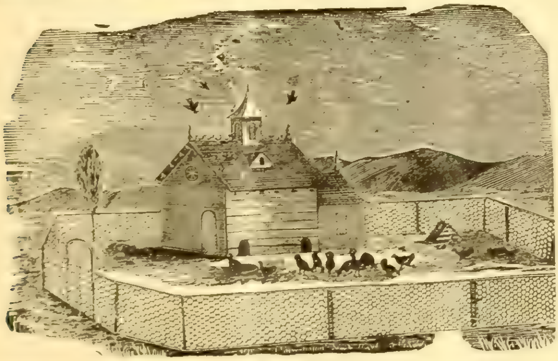
Galvanized-Wire Poultry-Netting and Fencing. The Best Made at the Lowest Price.

We handle only the G. & B. brand, which we consider the best made, as it is made of wire fully up to gauge, and has three-strand twisted-wire selvage, while other makes have only two. We have secured a carload from the factory, at a special low price, which we are able to sell lower than you can buy it anywhere else of equal quality, and lower than we have ever sold it before, though we have been getting more for it the past two years than we did in 1890. This carload that we have purchased is all 2-inch No. 19 netting, the size generally used for poultry. It was made nearly a year ago, and has lost some of the bright luster of fresh new goods; and it was for this reason alone that we bought it lower and are able to sell it cheaper. It is guaranteed equal in every respect to fresh new goods of the best quality, except in luster, which practically is of no account, because the brightest netting becomes dull in a few weeks after being put up. We have in stock all widths from 12 inches up to 60, which we can furnish at the following prices. All shipments must be made from here. We can not ship from New York or Chicago at these prices; but as we are able to secure through rates to almost all points from here, the freight will be little if any more than if shipped from either city. ¾-inch staples for below, 20c per lb.; 5 lbs. or over, 16c per lb.



Rolls 150 ft. long.	1 roll.	5 rolls.	10 rolls.	Rolls 150 ft. long.	1 roll.	5 rolls.	10 rolls.
2-in. No. 19, 12 inches wide,	$1 00	$ 4 50	$ 8 75	2-in. No. 19, 36 inches wide,	$2 90	$13 50	$26 00
" " 18 "	1 50	5 75	12 00	" " 42 "	3 40	16 00	31 00
" " 24 "	2 00	9 00	17 50	" " 48 "	3 75	17 50	34 00
" " 30 "	2 50	12 00	23 00	" " 60 "	4 75	23 00	44 00

The lot includes over 600 rolls, most of which are 48 inches wide, the usual size used. This price will last only as long as the stock lasts. You will do well, therefore to order early. The above prices are less than the wholesale quotations to-day on netting not one whit better, if as good. If you want other sizes, or shipment from New York or Chicago, write for our special 20-page netting catalogue, mailed on application.

BEE-HIVE STUFF FROM MEDINA.

The Dovetailed chaff hives came through all O. K., every thing in good shape. We set one up, and every thing went together in first-class order. The party is well pleased with them, and says he will order more this fall. All the hives and other goods I have ordered from you have been satisfactory in every respect, and I will continue to sell your goods.

The honey crop in this section was poor, averaging about 25 lbs. per colony, comb honey. Bees are in good shape for winter. J. E. SCHRECKENGOST.
Kittanning, Pa., Oct. 20.

Mr. Root:—Until recently I thought I might meet you and Ernest and Mr. Calvert in this world. I now have given up all hopes, but trust we may meet in the next. I am 25 years old, and for the last 7 years have seen nothing but trouble and sickness. One blessing I have is good parents. Life is sweet, and, generally, hard to give up by one of my age; but for God's rich promises I am ready to try the realities of another world. If it is not asking too much, please send me a word of consolation. Remember me in your prayers. Oh how I wish you all were here! A. I. Root, continue your good religious talks in GLEANINGS. I hope you may all live long and do as much good in the future as you have in the past. IRA J. WHITMORE.
Longley, O.

Before I proceed to business I must stop "by the way" a moment. I can't thank you enough for some recent articles in your publication. Now, some people call me a queer sort of preacher; and, no doubt, judging from the standpoint of 50 years ago, I am. I have a sort of theory that, for one to be a well-balanced man, he must develop his body as well as his head. There are few indeed who use themselves up by overstudy. It is rather by too little exercise. Well, I have a bicycle; and for times when I can't run that, I have a miniature machine-shop, with a fine foot-power machinist's lathe, to which I have made various attachments. I want to say further concerning the cycle, etc., that I am 41 years of age; began my ministry quite early in life, and, in consequence of my schemes for exercise, I do not remember that I ever lost a Sabbath in consequence of sickness. Medicine is an entire stranger to my system. A. M. PIPES.
Sioux City, Iowa, Oct. 8.

HONEY COLUMN.

CITY MARKETS.

NEW YORK.—*Honey.* The demand for comb and extracted honey is good, with stock enough coming in to meet all demands. Excepting fancy grades, which are not very plenteous, we have this year, so far, received as much honey within about 200 cases as last year already. 'Tis true it has sold more readily than last year, owing, we believe, to the scarcity of honey in the Western States.

Fancy 1-lb., 17; fancy 2-lb., 13@14; fair, 1-lb., 12@13; fair, 2-lb., 11@12; buckwheat, 1-lb., 10@11; 2-lb., 9@10. Extracted, clover and basswood, 8@8½; buckwheat, 6@6½; Southern, 65@75. *Beeswax*, 25@27.

CHAS. ISRAEL & BROS.,
Oct. 22. 110 Hudson St., New York.

NEW YORK.—*Honey.* Comb honey continues to arrive freely. Up to date we received 6159 crates. Fancy white is in good demand, and firm at 15@17 for 1-lb. and 12@14 for 2-lbs. The demand for off grades, white and buckwheat, is rather limited and these grades are slow selling at from 12@14 for 1-lb. fair white, and 11@12 for 2-lb. Buckwheat, 10@11 for 1-lb., 9 for 2-lb. Extracted in good demand. We quote: White-clover and basswood, 8@8½; Southern 70@75 per gallon.

HILDRETH BROS. & SEGELKEN,
Oct. 25. 28 & 30 West Broadway, New York.

NEW YORK.—*Honey.*—Fancy 1-lb. sections, clover, 15@16, in good demand; off grades, white, 12@14. Slow sale. Buckwheat in good supply, 10@10½, paper cartons most preferred. *Beeswax.* Pure, 25@26½, demand good; paraf. wax, 7@8; ceresin wax, 13½@15.

THURBER-WHYLAND CO.,
Oct. 20. New York.

BUFFALO.—*Honey.*—The honey market continues unchanged, firm and moderatedly active, with insufficient arrivals. We have not, in fact, any winter supply, and would like several tons, therefore, immediately; assuring all that can possibly be obtained for it in any manner here. Moderate sales, fancy 1-lb. comb, 15@16; do. No. 2, 12@14.

BATTERSON & CO.,
Oct. 19. 167, 169 Scott St., Buffalo, N. Y.

ALBANY.—*Honey.*—The honey-market has weakened some under increased receipts; but there is no accumulation of white comb honey.

White comb selling at 15@17; mixed, 14@15; dark and buckwheat, 10@11; extracted, white, 7½@8½; amber, 7@7½; dark, 6½@7. *Beeswax*, 27@28.

H. R. WRIGHT,
Oct. 14. 326, 328, 330 Broadway, Albany, N. Y.

MINNEAPOLIS.—*Honey.*—The market is picking up considerably. The supply is light and the demand is extremely heavy, particularly for fancy white-clover honey in 1-lb. sections. Choice white-clover is selling at 15@16. Fancy white-clover, 1-lb., 18@19. Strained honey in small packages 8@10; bbl. 300 lbs., 8c.

J. A. SHEA & CO.,
Oct. 13. 14 & 16 Hennepin Ave., Minneapolis, Minn.

MILWAUKEE.—*Honey.* The receipts of honey are very small. There is a good demand for 1-lb. sections; if of choice quality, will command 18c per lb., and may be higher if very perfect. The old is well sold out, and shipments of new will do well.

Choice 1-lb. sections, 18@20; same, common, 15@16. Extracted, white, in kegs and cans, 8@9; dark, 7@8.

Oct. 13. A. V. BISHOP,
Milwaukee, Wis.

PORTLAND.—*Honey.* Comb honey is not moving off very fast. We are selling light amber comb at 15@16, and white at 16@17; extra white, 17@18. Light amber extracted selling at 8½; extra white, at 9.

Beeswax, 26@28. LEVY, SPIEGL & CO.,
Oct. 12. Portland, Oregon.

KANSAS CITY.—*Honey.*—We quote: Comb, No. 1 white, 1-lb. comb, 16@17; same, No. 2, 14@15; No. 1 amber, 1-lb., 15@16; same, No. 2, 12@13. Extracted, white, 7½; amber, 5@6. The receipts of honey are very light, clean, and good. *Beeswax*, 22@25.

Oct. 21. CLEMONS-MASON COM. CO.,
Kansas City, Mo.

CLEVELAND.—*Honey.* We quote the following prices at which honey and beeswax are selling in our market to-day. White-clover honey, in one-pound sections, selling from 17@18c, strictly A1. Second grade, 15@16c. Third grade, 10@12. *Beeswax*, A1, selling from 24@25c per lb. We are handling large quantities of honey, and are prepared to handle for parties who will favor us with shipments, and will make prompt returns for all goods consigned to us. We guarantee sales on all products handled by us.

REYNOLDS & WILLIAMS,
Oct. 27. 80 & 82 Broadway, Cleveland, O.

CINCINNATI.—*Honey.* Demand is good for all kinds of extracted honey at 5@8c on arrival. There is a fair demand for comb honey, at 15@16 in a jobbing way for best white. *Beeswax* is in fair demand at 20@25 on arrival, for good to choice yellow.

CHAS. F. MUTH & SON,
Oct. 22. Cincinnati, O.

KANSAS CITY.—*Honey.*—There is a good demand for honey, but a very light supply. Price of 1 lb. comb, white, 17c. Extracted, 6@7½. *Beeswax*, 22@25.

HAMBLIN & BEARSS,
Oct. 22. 514 Walnut St., Kansas City, Mo.

CHICAGO.—*Honey.*—Demand for white comb honey is steady, and we get 18c for best lines. Dark honey is moving at 13@15; extracted selling at 6@9, according to quality. *Beeswax*, 25.

R. A. BURNETT,
Oct. 19. 161 So. Water St., Chicago, Ill

DETROIT.—*Honey.*—Best white in good demand at 14@15. Not much offered. Extracted, 8c for light-colored. *Beeswax*, 25@26.

M. H. HUNT,
Oct. 19. Bell Branch, Mich.

SAN FRANCISCO.—*Honey.*—We quote extracted honey at 7¼@7¾c, and it is scarce at that. Comb, 1-lb., 10@12; 2-lb., 9@12. *Beeswax*, 24@26.

Oct. 11. SCHACHT, LEMKE & STEINER,
San Francisco, Cal.

ST. LOUIS.—*Honey.*—No change in comb. Extracted in good demand at 5½@6¼. We will give 6¼ laid here for light-colored, good-flavored honey. *Beeswax*, 24½.

Oct. 20. D. G. TUTT GRO. CO.,
St. Louis, Mo.

BOSTON.—*Honey.*—Best white, 1-lb., 18@19. Best extracted white, 8@9; dark, 6@7. *Beeswax*, 25.

BLAKE & RIPLEY,
Oct. 20. Boston, Mass.

FOR SALE.—5000 lbs. choice white-clover and basswood honey; all in 1-lb. sections, packed in 12-lb. single-tier crates, delivered at R. R., 16c per lb.

21d FRED H. FARGO, Batavia, N. Y.

WANTED.—50,000 lbs. of choice white comb honey.
Address BYRON WALKER,
17tfdb Evart, Mich., or Wyalusing, Wis.

FOR SALE.—1000 lbs. buckwheat comb honey.
20tfdb D. F. LASHIER, Hooper, N. Y.

FOR SALE.—10 barrels choice white-clover honey. Will put it up in almost any style of package desired. Price on application. 20tfdb

Winter Losses

Are not always the result of the same cause. They may come from starvation; from poor food; from improper preparations; from imperfect protection, or from a cold, wet, or possibly a poorly ventilated cellar, etc., etc. Successful wintering results from a proper combination of different conditions. For clear, concise, comprehensive conclusions upon these all-important points, consult "ADVANCED BEE CULTURE." Five of its thirty-two chapters treat as many different phases of the wintering problem. Price of the book 50 cts.; the REVIEW one year and the book for $1.25. Stamps taken, either U. S. or Canadian. New subscribers to the REVIEW for 1893 receive the balance of this year free.

W. Z. HUTCHINSON, Flint, Mich.

STRAY STRAWS

FROM DR. C. C. MILLER.

I'M SORRY for Bittenbender's loss. He's a real nice fellow.

WILL AN ESCAPE make quicker work in day time or at night?

GRADING HONEY is a coming topic for discussion in *British Bee Journal*.

COMMISSION MEN, this year, are sending out, offering to *buy* honey. That tells its own story.

O. B. BARROWS says he doesn't know of any use for a valve in a smoker. They're better in theory than in practice.

AND NOW the *American Bee Journal* has gone to calling names—calls me a "stray strawer." Et tu, Brute?

HARD COAL is in both of my cellars. I don't propose to repeat the experiment of going through another winter without fire. But wish I had a warmer cellar.

HENRY ALLEY sounds a warning against introducing queens that produce five-banded bees. He says, "As surely as you do it, your apiaries will be ruined, and you will soon give up keeping bees, in disgust."

"THE OLD RELIABLE" *American Bee Journal* has washed its face, combed its hair, and put on a spick and span new holiday suit which it means to wear 52 times in the year. It's really gotten up in delightful manner.

NON-SMOKERS, in the last graduating class in Amherst College, have gained in weight 24 per cent. over the smokers; in height, 37 per cent; in chest girth, 42 per cent; and in lung capacity, 8$\frac{36}{100}$ cubic inches.—*Medical News*.

GIRDLING grapevines makes them bear younger, makes larger fruit, but are you sure it makes "finer" fruit, friend Green (p. 770)? Girdled grapes that I have seen were finer in appearance, but decidedly inferior in quality.

HICCOUGH, even the worst cases, says *Medical and Surgical Journal*, can be cured by a teaspoonful of pulverized sugar wet with an equal quantity of wine vinegar, taken at one dose. I suppose honey vinegar would do just as well.

SOME FRUITS, apples, berries, etc., whilst of fine quality, are such poor bearers that they are not worth raising. Isn't it so with lindens? and if we're to cultivate them, may we not just as well have the best? I've noticed a big difference in their productiveness.

E. F. QUIGLEY says the cause of swarming is nature. Well, if that's all I guess we can manage it. It's nature to raise lots of drones, but we stop that by cutting out drone comb. Now tell us, Bro. Quigley, "what in nater" is the particular thing that makes the swarming, and we'll fix 'em.

AUGITE STOVE-MAT, page 784. No wonder it won't burn with such a name as that. But my wife says it's just the thing she needs; so send your wagon around with one, friend Root. If the wagon's too busy, send a boy, or a man—Uncle Sam, for instance.

PROF. COOK, in a stirring article in *American Bee Journal*, is very positive that some of the $750,000 annually appropriated for agricultural research should be used directly in the interest of bee-keepers. But bee-keepers are too modest to clamor for their rights.

BEE-ESCAPES don't always work alike. We read how nice it is to put them on at night and find the bees all down by morning, but I put one over a strong colony, and the bees were not all below the escape till the end of a week. That was in the first part of October.

THOSE RASPBERRIES that are ever-bearing. Don't pin too much faith on them. I've had them. They'll give a nice crop once in a while (they always bear on the new shoots), but again they'll do nothing for a long time—altogether too cranky. I'll be surprised, friend Root, if you give them ground room three years from now.

I'VE BEEN LAID UP with a lame back. To turn over in bed was exquisite torture. I've enjoyed it—enjoyed the thought that so little of my life I've been unable to get around, and the thought that I have such kind friends when I can't take care of myself. I might have forgotten it but for this little spell. I'm nearly myself again.

THE NEW CELERY CULTURE. You know what it is. No banking up to bleach. Well, you ought to see my bed. Got the plants from Medina. Of course, the plants were more or less green when I got them, but in two weeks there wasn't a green spot on the bed—nor a white spot either. Grasshoppers cleaned it to the ground. Saved me lots of watering and manuring.

THAT FLAP-JACK ACT, p. 768, is a dangerous affair. If Bro. Wilder misses that flap-jack as it comes down he'll make a desperate effort to recover it; his jaws will come together with a snap, and his tongue will be a good deal shorter. Pull down your trousers legs, comb your hair, and look up a wife, Bro. Wilder, to turn your flap-jacks in the orthodox way. If for nothing else, do it as an example for Rambler.

DOES FREEZING hurt comb honey? Generally speaking, yes, very decidedly—cracks, granulates, leaks—in fact, frozen comb honey is generally ruined as a first-class article. But not always. I knew two cases, one in Illinois, one in Pennsylvania, where honey was frozen all winter in an attic without injury. But it had been roasted in that attic through the summer. At least *some* honey, if rich enough and thick enough, is not hurt by freezing.

"SWARMS WITHOUT QUEENS will not double up by going to a strange hive," says friend Dibbern, p. 765. If he means swarms that have clipped queens, so that the queens can not go with them, I'm sure the rule does not hold good with my bees. I can't see how it would make any difference whether the queen were fastened in the hive or tumbling around on the ground; still, facts can not be disputed; and if it proves true in the case of self-hivers, it's a big item in favor of hivers.

LANGSTROTH'S REMINISCENCES.

HIS EARLY CAREER; THE BREAD AND BUTTER REBELLION AT YALE COLLEGE.

My father, wishing to give me the advantages of a college education, placed me in the preparatory school of the University of Pennsylvania, then under the charge of Rev. James Wilbanks, who was a good classical scholar, and had the faculty of inspiring his pupils with a genuine love for the verses of Ovid, Vergil, and Horace. We committed hundreds of lines to memory, many of which I have never forgotten. It was a lesson never to be forgotten, to hear him, all alive with intense satisfaction, repeat those noble lines of Horace:

> Justum et tenacem propositi virum,
> Non civium ardor prava jubentium, etc.

Mr. Wilbanks was a disciplinarian after the very straightest sect of the Old School. If I was late, and had no excuse, I always stepped up to his desk, and held out my hand and took my punishment with as much grace as I could. The rod! the rod! this was the universal arbiter, from which there was no appeal. I once pronounced the word "a-*mi*-cus" as though it were "*am*-i-cus." In a thin voice, so shrill as almost to resemble a squeal (I can almost imagine that I still hear it ringing in my ears) he cried out to me, "*Am*-i-cus, Lorenzo! I'll *am*-i-cus you! That word is a-*mi*-cus!" and down came his rod with such an effective emphasis that I never forgot to say a-*mi*-cus.

But although he used the rod so freely, it was only in the way of what he thought his duty, and I never associated his name with any thought of cruelty. He made me a good Latin scholar, and his memory will ever be a pleasant recollection.

I entered the freshman class of Yale College in the fall of 1827. Strange to say, notwithstanding my early passion for investigating insect life, I can not remember, with the exception of a few trifling observations upon the habits of glow-worms, that I took the slightest interest in my old pursuits. My attention was mainly given to mathematics and *belle-lettres* studies, and I was always among the successful competitors for excelling in English composition. I roomed, in my freshman year, at the house of my college guardian, Prof. Denison Olmstead, who had charge of the college meteorological observations, and who inspired me with a great fondness for his favorite pursuits.

In the summer of 1828 occurred what will ever be famous in the history of Yale College as the great "Bread and Butter Rebellion." The students were all required to board in commons, unless they could procure a physician's certificate that their health required a different diet. The summer was unusually hot. The bread was not always sweet nor the butter fresh, and loud were the complaints made against the regular fare. At a meeting of the different classes, a resolution was unanimously passed that the students should show their dissatisfaction by absenting themselves one Monday morning from the dining-hall. Word had come to our venerable president, Jeremiah Day, of what the students purposed. So after morning prayers, which he usually conducted, he addressed them, in his wonted kind and courteous manner, telling them that, if they had causes of complaint about their fare, they ought in a respectful way to make them known to the faculty, whose interest it certainly was to have them remedied. He closed his appeal by affectionately warning us against any hasty and improper proceedings, which could only result in evil. But our passions were too much inflamed, and we were too much under the influence of those who had planned the original demonstration, to listen to any thing our good president could say. So when the bell rang out the summons for breakfast, crowds gathered around the dining-hall. None entered; but all, with loud shouts of defiance, expressed what they thought to be a proper sense of their wrongs.

Before dinner the classes met again for consultation, and their leaders now advised that they should decline to take any meals in commons until they had sufficiently expressed their indignation for the kind of food which had been served to them, and had obtained assurances from the faculty that their grievances should be redressed. Thus was inaugurated an absolute rebellion against the constituted authorities. I narrate these events more at length because of the important influence which they had upon the formation of my character. Before entering college I had promised my parents to obey its laws, and to give them no occasion to regret the sacrifices which they were making in my behalf. I saw that the course which we were now pursuing was a direct violation of that pledge; and, without consultation with any one, I determined to retrace my steps, and to go into the dining-room at the next meal, even if I went alone. At a meeting of our class I announced this determination, saying that we all knew that we were violating our matriculation pledges, and that, while I did not profess to be governed by a higher sense of right than others, I did intend to redeem as far as I could the promise which I had made to my parents.

I left the meeting after these remarks, and a committee was appointed to remonstrate with me, and to assure me that, if I persisted in my intentions, I should be treated by the whole class with merited contempt. The hour for dinner arrived, and the students were assembled in unusual numbers, as the report of what I meant to do had become generally known. Yells of execration greeted my appearance, as alone I ascended the steps leading to the dining-hall; stones were thrown at me; and one student, more daring than the rest, drew a pistol and threatened to shoot me. Nothing, however, could move me, for I was nerved to such a pitch of determination that I would have submitted to instant death rather than change my purpose.

In the afternoon of that day, my guardian, Prof. Olmstead, who knew nothing of my intentions until all was over, informed me that, by vote of the faculty, I had been excused from entering the hall again, and that my safety, and his duty to my parents, demanded that he should prevent it. I told him that they might kill me, but that I would never yield to them: and when I entered again, quite a number, most of whom I think were professors of religion, were emboldened to enter with me.

The issue of this affair was, that some students were expelled from college, all recitations were suspended, and the students returned to their homes. Only after signing due apologies were they allowed to resume their studies, at the beginning of the next college year. The course which I had taken, though it was at first so unpopular, in the end made me a host of friends. It was probably the turning-point in my life, for my natural disposition often inclined me to yield my own convictions of duty in order to be on the popular side. It would be difficult to tell how much I owe to that "Bread and Butter rebellion." L. L. LANGSTROTH.

(*Continued.*)

SHIPPING HONEY FOR EXHIBITION PURPOSES.

HOW IT IS DONE OVER IN ENGLAND.

Some two or three years ago, when Mr. C. N. Abbott, of the firm of Abbott Brothers, was here, he exhibited to us some samples of various bee-appliances used over in England; and among other things he showed us a shipping-crate provided with spiral springs, so that a case of choice comb honey could be put therein and shipped to a distant market. With such a contrivance the case could be dropped or tumbled around on the floor, and no damage occur to the honey, because the spiral springs absorb the concussion. We thought at the time we would give a description and illustration; but we had quite forgotten it until by chance we were looking over a back number of the *Bee-keepers' Record* for May, 1891. In this we found an article with engravings, describing much the same arrangement. As we are approaching the time when many of us will be thinking of shipping our honey to the World's Fair, and placing it on exhibition, we have concluded to reproduce the article entire, with engravings. Of course, the method shown below and described, is altogether too expensive for ordinary shipments; but where it is desired to send exhibition honey, and particularly a crate of extra choice combs so that it shall arrive at the exhibition grounds in perfect order, it may be advisable to use the method. "It is English, you know;" but the "English, you know," are far ahead of us in honey exhibits.

If we can do any thing by way of inducing exhibitors at honey shows, who may read these papers, to bestow a little consideration on the unfortunate and usually overworked "Hon. Secs.," and others who have charge of the "staging," we shall be aiding in the removal of a source of frequent trouble and annoyance to these latter gentlemen which is altogether inexcusable; and the worst of it is, it frequently happens that those who take most pains in packing their exhibits for transit to the show give quite as much trouble as those who take least; for the time and labor involved in unpacking and repacking some exhibits is, as we know from personal experience, "a caution." We therefore propose to show how bee-keepers, who aspire to "show" honors may send their dozen sections or their dozen jars of extracted honey by rail to the show, and have them unpacked, staged, repacked, and returned safely with the minimum amount of trouble to all concerned, and with no great outlay for appliances.

The cut (Fig. 1) represents a crate for holding a dozen one-pound sections; and as no great amount of skill is involved in its construction, it may be said that any amateur joiner can make it for himself. It is a box within a box, the inner one resting on six spiral springs fastened to the bottom of the outer box, while the inner one is pulled down a little by a strip of leather at each corner, as shown. This form of crate, without the lid, was first introduced by a well-known firm in 1886, and it answers the purpose admirably. The lid we had made for our own use, and its construction will be at once seen in the cut. The lower or inner lid is of thin board cut small enough to fit easily inside, close on to the tops of sections. The upper one is of the same light wood, with cross-pieces at each end, of three-quarter-inch stuff, and a strip of the same forms a handle to lift by. Five springs are fixed between these two lids and fastened to both, so there is no risk of one being lost. A stout screw driven in at each corner forces this double lid close down on to the sections, and keeps them firmly in place. As all sections sent to shows must be glazed, no other glass protection is used. The inner box is made 12¾ inches long by 8½ inches wide, so there is room for a small roll or wedge of corrugated paper to be slipped down at the outside of each row, which keeps them firm in place, and, when withdrawn, allows the section to be lifted out readily. Except to caution the maker not to cut the end-pieces of the crate so that the screws are driven into the top of the grain, and to have all its parts strongly nailed together, no further instructions are needed for making, save a close inspection of the cut.

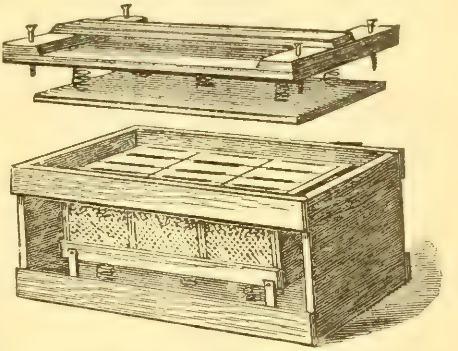

FIG. 1. A SHIPPING-CRATE FOR HOLDING COMB HONEY FOR EXHIBITION PURPOSES.

For extracted honey in glass jars, make a strong box divided into twelve partitioned squares, as shown in cut (Fig. 2). The exact size of these squares is determined by the particular make or form of the honey-jar used, but they are made sufficiently large to hold the jar comfortably when the latter is encircled by a fold of corrugated paper. The bottom of each portion has also a square of the same paper on which the jar rests. A strong lid hinged, on the inside of which is nailed a square of corrugated paper as shown, completes the box, while the height of the jars is so arranged that the ridged portion of the paper rests close on the screw-caps and keeps all firm. A single screw in the center of lid at the front fastens it down; and when a strong cord or rope, with a nail driven through it at the bottom, to keep it fast to the box and prevent its going astray, is tied around the whole, with a label on the top as before, the package is ready for traveling any distance without breakage.

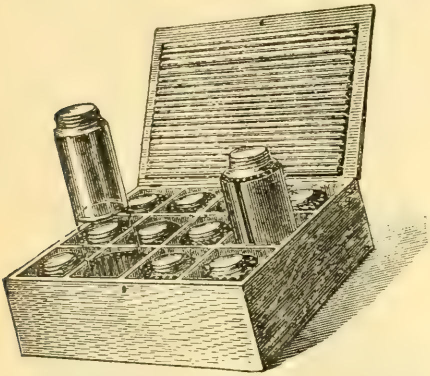

FIG. 2. A SHIPPING-CRATE FOR EXTRACTED HONEY.

The saving of trouble and labor to the officials of a show when dealing with honey packed in this form is simply astonishing. The cord is untied, the single screw drawn, and the jars lifted out without disturbing the packing one bit, or losing any of the parts. There is no littery mess about; the box is put away; when wanted after the show is over it is ready for dropping the jars into, and the honey is safely repacked for the return journey in about five minutes.

Those who have had to do with shows will know what this means, and we therefore venture to express a hope that exhibitors will earn the gratitude of officials, and at the same time conduce to their own satisfaction, by following our advice in the matter of "packing honey for shows."

It will be observed, that, in packing comb honey for traveling to shows, spiral springs are relied on for safeguarding it from damage; and for glass jars, corrugated paper is made to act as the "buffer" against breakage. Both articles are very inexpensive, the springs costing only a few pence at any ironmonger's, while corrugated paper is sold at less than a penny per superficial foot. Unlike a bee-hive, no great accuracy is required in making, so that amateur joinering is peculiarly suited for making both section crate and box for jars. At the same time any appliance dealer will make them for a very small cost when it is understood that only rough, strong articles are required.

It sometimes happens that persons have to assist in staging and unpacking who are not accustomed to handling honey, and these gentlemen are placed at a double disadvantage when bad packing has to be dealt with. Referring to persons unaccustomed to handling honey, and the many "slips" they make through inexperience, we may conclude this paper with an illustration from our many experiences. Some fifteen years ago we had as regular customers for honey the establishment in the North known as the headquarters of the Mormon community at the port of embarkation from this country to the Salt Lake. The chief elder or officer in charge was a very nice fellow indeed, highly intelligent, well read, a man of much travel, and, but for his peculiar religion, a gentleman with whom we could have got on very well indeed, especially as he knew something about bees. He was especially fond of good honey, and, moreover, was a first-rate judge of its quality. We took especial pride in supplying him with our best, and he always paid us 1*s.* 6*d.* per pound for extracted honey in bulk.

The season in question was a good one, and the honey in Cheshire was extra fine. So our friend sampled out a quarter-hundredweight; it was put into a large stone jar and taken a distance of six or seven miles to his place by a special messenger of our own, who carried it all the way. The honey was, after the long journey, safely handed over to a servant, and by him carried down a dozen stairs; and two minutes after it left his hands our messenger was asked to "come down and see what could be done, for the servant had dropped the jar!" He went and found the jar broken, the contents all over the kitchen floor, and the culprit a standing lesson in handling honey by an inexperienced carrier!

DIFFICULTIES WITH THE HOFFMAN FRAME.

FAIR AND CANDID CRITICISMS.

The honey crop in this section is over about June 1. It was below the average this year, owing to late frosts after fruit-bloom, and very dry weather in May. An average taken in this county would give perhaps 40 lbs. of comb honey per colony. The bees have abundant stores, however; and as we never lose any colonies on account of the "winter problem" there is no cause for complaint. Fortunately for us, we have no winter problem. Bees will gather pollen freely at Christmas time if the weather is fine, as it was last December.

I have used the new Hoffman frames this season, by way of trial, in 15 hives, all transferred colonies. I am afraid they will not do for this latitude. Dr. Miller's prophecy is fulfilled very exactly. That sliding of frames, and handling them in groups, of which I had pleasant visions, has gone where other dreams go. To separate those frames now, after six months' use, is suggestive of candy-pulling. By and by it will suggest the firing of toy pistols. What I shall do with them next year is a question which my prophetic soul does not like to dwell upon. The horizontal wiring, three wires, with medium brood foundation, gives beautiful results; the combs are fine. I do not like the new top-bar with beveled comb-guide. The bevel seems to act as an incentive to the bees to build burr and brace combs all over the top-bars. This in Dovetailed hives. The old thick-top-bar, $1\frac{1}{16}$ inches wide, $\frac{7}{8}$ inch deep, with flat comb-guide, gives results so much better that I shall certainly use that kind in future. For spacing the thick-top-bar frames I use the ordinary double-pointed tinned carpet-tacks. One of these is driven longitudinally into the top-bar, an inch from the end, on the left, facing you. Turn the frame around and drive another. They project $\frac{5}{16}$ in. from the top-bar. These can not be glued fast; frames are easily moved, and the whole thing is a comfort in handling. We shall have to come down to metal of some kind in those parts of frames which can be propolized.

A. T. PEETE.

Branchville, S. C.

[We have before expressed the fear that the Hoffman frames would not answer in certain portions of the South, and in those warm countries where propolis is gathered more freely than here in the Northern or Middle States; but notwithstanding that, just the other day an order came from Cuba for 5000 Hoffman frames, the party, we believe, having already tried a few during the past season. We have no doubt that the staples already referred to by other correspondents would answer very nicely; but the common run of bee-keepers would not drive them in just far enough to give exact spacing; and, of course, there is that old objection of their being in the way of the honey-knife in uncapping.

In regard to the Hoffman frames in our own apiary, we would say that we have just been out in the apiary and manipulated them in colonies that are the worst propolizers—the hybrids. We found no special difficulty in handling them, but we realize that there are some who would not like them, even in our own yard.

In regard to the burr-combs on the new Hoffman top-bars, your experience is at variance with our own, and with the reported experience of others. Although we had a very heavy honey-flow, and the bees crowded every bit of available space, the top-bars were left intact so far as the wax accumulations were concerned.]

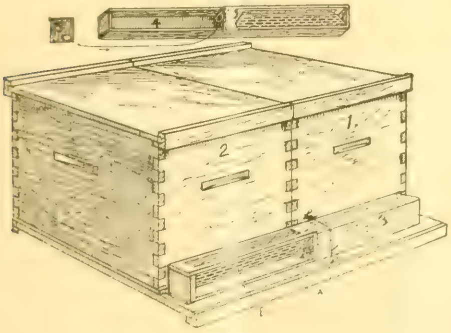
SPRAGUE'S AUTOMATIC HIVER.

HOW IT WORKS, ETC.

My hiver has proved to be a perfect success. I send you a drawing and explanation of it as you requested. The tin slide is a very important adjunct. Slide it in place, and it changes the hiver into a bee-escape from the old hive to the new.

I have just placed a new hive with one frame of brood and two empty combs by the side of an old one, and put on the hiver with the tin in place. In two days nearly all the bees from the old hive were in the new one, with five queen-cells started. You see that it will be a success so far as getting the bees is concerned. If some of them should return to the old hive when the swarm comes back, they can be gotten with one minute's labor.

I want it called a hiver and not a swarmer. When the bees are caught I want them hived, and not caught in a trap for me to hive. It is cheaper for me to keep the required number of Dovetailed hives and use them than to keep around a stack of bee-traps.



SPRAGUE'S AUTOMATIC HIVER.

Fig. 1 shows the old hive moved two-thirds its width to the right. Fig. 2 is the new hive occupying two-thirds of the space where the old one stood. Fig. 3 shows the hiver in place. Fig. 4 is a hiver leaning against the hive, giving an inside view. This should be three inches square, inside measure. Fig. 5 is a square tin, to be placed against the square zinc in the hiver after the swarm has returned. The hole is to fit the mouth of the cone, changing the hiver into a bee-escape.

The zinc in the front of the hiver is placed diagonally from the front upper edge to the back lower edge, the end of which fits closely to the little square zinc, leaving one half of the square zinc for the bees to work through without having to pass through the large zinc which is to catch the swarm. (A) is the entrance to the old hive; (B) is the entrance to the new hive. The hiver is held in place by means of one nail driven into the hive and another into the bottom-board, and connecting these with stovepipe wire.

My method of using it is, to catch the swarm in the new hive; place the super from the old one on the new one; slide the tin in place to drain it of bees and prevent further swarming; also to make the new swarm strong. I then move the old hive to a new stand, and all is done.

The cone should be 2½ inches long, with an apex ¾ of an inch in diameter. This allows them to carry the dead bees through it without clogging, and it works all right.

While I can see no improvements to be made upon this now, some one else will. Let such have a chance.

Haskinville, N. Y. **Geo. H. Sprague.**

THE QUALIFICATIONS OF AN APIARIST.

SOME GOOD HINTS FROM G. M. DOOLITTLE.

As the labors of the season draw to a close, and the long winter evenings are soon to be upon us, I thought that I might be excused if I were to say a few words on what I consider the duty of the apiarist along the line of spending these evenings in such a way that we may be gaining in knowledge regarding the pursuit we have chosen in life. Having once chosen a pursuit in life, it becomes all to look after that pursuit with all diligence; and in no business engagement is this more imperative than when the culture of the honey-bee is to be the occupation; and in no way can this be done to better advantage than in reading the bee-literature of the day. How often have I tried to get certain persons to take a bee-paper, or to send for a good book on bees, only to be met with certain excuses which went to show that the persons addressed would not make a success in bees. A man who is not willing to put a few dollars into the bee-reading of to-day shows by that very thing that he will not make a success of it; for if he has the right kind of love for the little busy bee he will devour all the reading on the subject which comes in his way, as eagerly as a hungry man eats his dinner. It is just this hungering and thirsting after knowledge regarding the practical part of bee-keeping that insures success; and unless a person does so hunger and thirst after knowledge along *some special line* of the many industries of the world, he or she will never make a success at any thing. One of the reasons why there are so many "calamity howlers" in the world to-day is because there are so many who are more interested in loafing around and listening to idle gossip than they are in their chosen pursuit in life, and take more interest in sitting around the saloon or the store than they do in studying on something that will lift them up financially and morally, or make them of use in the world. Besides GLEANINGS, take all the other bee-papers which you possibly can; and, before any of these, be sure to get at least one good book on bees. Why I say procure the book or books first, is, that no man is ready to understand the bee-papers till they are acquainted with the elementary principles of our pursuit. There is scarcely a week passes but that I get lists of questions which I know wouldn't have been asked had the writers a good book on bees, and had they read that book understandingly. From these papers and books the mind is to be stored with useful knowledge which can be put into practical use as soon as the season of 1893 opens. When I first commenced bee-keeping, I procured the "Bee-keeper's Text-book" and "Quinby's Mysteries of Bee-keeping," and subscribed for the *American Bee Journal* and the *Bee-keepers' Journal*, the two latter being all the papers devoted to bees there were at that time. By the reading of these I was greatly benefited; and from the writings of E. Gallup, L. L. Langstroth, M. Quinby, A. I. Root, Adam Grimm, and many others, I learned my A B C in bee culture.

My first year of experience in bee-keeping, by way of putting the things which I had read in practice, resulted in 12 lbs. of comb honey and one swarm from the two I had purchased to commence with, in the poorest season I have ever known in all of the 23 years I have kept bees. The next season I obtained about 25 lbs. of surplus from each colony I had in the spring, on an average. At the end of the fourth season I chronicled an average of 80 lbs. comb honey as the average surplus from each colony in the spring. During these four years I had studied, read, and practiced all my wakeful hours about the bees, having keen enjoyment in doing the same, for I never spent an hour in my life, even up to the present time, in work pertaining to bee culture without its being a real pleasure to me; and this was brought about by those winter evenings when I first began to read up on the subject. Many a night have I lain awake from one to three hours, planning how to accomplish some result I desired to achieve in regard to the practical part of apiculture, which, with the help of what I had read, caused me to accomplish what I had sought after. I have found that, if I would succeed, as far as possible I should read mainly those articles which came from the pens of practical bee-keepers, for such were the ones who made a success of their calling, and told how they did it. If you wish to learn mechanics, the mercantile pursuit, or farming, to whom do you go — the man who allows weeds and briers to grow up all over his farm and in his business, or to the man who makes a success of his every undertaking, year by year? To the latter, of course; and so we should do in bee-keeping matters. I know that many of our most practical bee-men do not write for publication, and for this reason we can bring in visiting, during the winter months, as another help along this line of our qualification. Then we have our bee-conventions, which are held for this special purpose; and while the cost may be considerable, if we improve the time as we should we can learn more than enough to make that cost good, besides the benefit which we derive socially.

All of these things are great helps to us, and should be eagerly sought after, as they will be if we have a natural qualification for the calling which we have chosen. If any person loves something else more than he does to study into bee-keeping, and does this only as a sort of duty, let him be assured that he has mistaken his calling, and the sooner he leaves it and goes to that which at all times gives him pleasure, the better he will be off in this world's goods, and the better it will be for the world.

If there are any who read this who have no love for any thing, except to sit around all winter, whiling away the time in that way, let me say to them that the world would have been better off without them, and that these lines were not intended for them, unless they can turn over a "new leaf." G. M. DOOLITTLE.

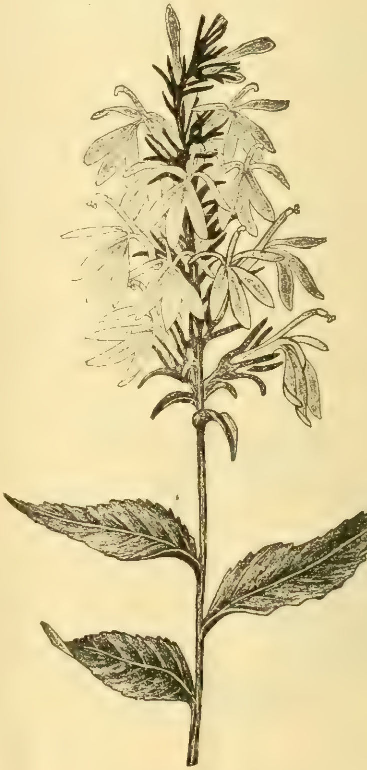
Borodino, N. Y., Oct. 18.

CARDINAL FLOWER.

SOME OF PROF. COOK'S STATEMENTS REGARDING IT REVIEWED; NOT A HONEY-PLANT.

On page 926, 1888, Prof. Cook gave us an interesting article on the cardinal flower, or *Lobelia cardinalis*, and speaks of it as a honey-plant. In a postscript he noted the fact that, in correspondence with him, I had questioned the statement that the cardinal flower furnished any nectar for the honey-bee; but from evidence which he received through friend Hilton, of this place, he was confident that I was mistaken, and that another plant must be enrolled among those which produce honey.

On p. 351, 1889, and afterward in corrrespondence with Prof. Cook, I explained my position to him. He stated to me that he himself had never seen a bee on the cardinal flower, and requested me to make investigation to ascertain the facts in regard to the matter. This I have done, and am now ready to give the result of four years' observation.



CARDINAL FLOWER.

To bring the matter clearly to the mind of the reader I will quote a passage from Prof. Cook's article, in which he nicely describes the flower; but I am certain he draws some unwarranted conclusions. Please read it carefully; and if you are not familiar with the flower, observe the cut closely. He says:

"The corolla is irregular. These flowers need the visits of the bees greatly; and let us see how hospitable they undertake to be. *Note the three broad petals. They not only say come, by their bright hues, but by the restful footstools which they offer the weary bees.* As can be seen in the figure, the stamens are united, both by their filaments and anthers, and so form a tube around the pistil. In the upper flowers that are open, we see the anthers. The style bears a tuft, or brush, which, by growth, pushes out of the stamen-tube after the flower opens, *thus brushing off the pollen. After it pushes out, the bi-lobed stigma opens.* See the lower flowers in the figure. Thus we see the pollen is shed first, and so these flowers *must* have the aid of the bees. The pollen is dropped before the stigma is matured. At the base of the style, upon the ovary, is a *copious secretion of delicious nectar.* The bees come eagerly for this nectar, and thus unconsciously cross-fertilize the several flowers. Even as good a botanist as Prof. Goodale, of Harvard, says, 'The cardinal flower, however, has so long and narrow a corolla-tube *that the bees are unable to reach the nectar*, which, moreover, is *so watery* that they do not in this case resort to their frequent expedient of biting through the corolla to get at it.' "

Prof. Cook then criticises Prof. Goodale's statement, and concludes with the following:

"We now know that this cardinal flower is a most excellent honey-plant. If I succeed in showing everybody that they ought to plant cleome for their bees, I will next try this lobelia."

The italics in the above quotation are mine.

Now in regard to my investigations. During the past four seasons I have repeatedly visited patches of the cardinal flower in a region where there are plenty of bees, and also plenty of the flowers, and have never seen a bee upon the flowers. Neighbor Ashcraft, who for two years handled one of G. E. Hilton's out-apiaries, and who is a wide-awake bee-keeper, has done the same with like results. I am certain that Prof. Goodale is correct. The nectar found in the blossom is, as he says, watery, and also rank, and I have always found it limited in quantity, and not, as Prof. Cook states, "copious and delicious." The cardinal flower blossoms just at a time when the bees are searching every nook and corner for honey. Would it seem possible that they would ignore the flower if there were any nectar there which they could get at, even if it is poor? I think not.

As regards those footstools: A bee resting on those three petals could not possibly reach the nectar, owing to the size of the flower; and then the nectar, what there is of it, is at the bottom of that long tube, entirely walled in, and decidedly inaccessible to the honey-bee. In all the flowers I have examined, the bee would need a tongue much longer than himself, and, in some cases, two or three times as long, in order to reach the nectar. The close-fitting top of the tube would not be the least difficulty the bee would have to overcome. I am positive that no honey-bee can gather honey from *Lobelia cardinalis.* And, by the way, friend Cook, did you ever see a bee, when gathering honey, stop to rest? But you will say that a bee must have a foothold. Granted; but, as just stated above, a bee on those petals could do nothing but rest.

Now comes up the question, "How are the flowers fertilized, if insects do not do the work?"

The lower flowers mature first, and in such a manner that their pollen is shed before the stigma opens, hence the stigma must receive its fertilizing pollen from another flower. At the time that the lower stigmas are waiting for pollen, the upper ones are just shedding their pollen; and what is more natural than that, as it is wafted downward, some of it should rest upon the stigma below, and do the work nature intended it to do? Nor is this so much chance-work as would appear at first, because, for each stigma, or, better, for each ovule, there are hundreds of grains of pollen ripened. This process goes on as the flowers mature on up the stalk. Another fact tending to prove this is, that the highest flowers mature no seed.

I am afraid that, when Prof. Cook wrote his article, he forgot what he has so often taught, and wisely, too, that careful, practical, personal observation is of much more value than hearsay evidence. Prof. Cook received his information from friend Hilton, who, in turn, received it from another party. I am certain that this other party was mistaken in the source of his honey.

In what I have written I have spoken pointedly; but I believe friends Hilton and Cook will take no offense, for both are lovers of the truth, and gentlemen for whose honor and scholarship I have much respect.

By the way, neighbor Hilton has just been nominated to represent this county in the State Legislature; and although the writer is a member of the opposition party, he will not be surprised if, after Jan. 1, our energetic bee-keeping friend would be known as the Hon. G. E. Hilton. W. E. GOULD.

Brookside, Mich., Oct. 12.

* * *

HONEY RESOURCES OF CALIFORNIA.

PRIOR RIGHTS TO BEE-RANGES; ANOTHER VIEW OF THE MATTER.

In a recent trip from Newhall to Mojave, from Mojave to Needles, and from Needles to San Bernardino, I had an opportunity for observing the honey-plants under various conditions of climate and at varying altitudes. In the vicinity of Newhall the three varieties of sage we have here are found on every hill; but as our train went puffing along up-grade they became noticeably less until after passing Acton, where none were to be seen, being replaced by the wild buckwheat. So it was in coming over the range between the desert and San Bernardino; first the buckwheat, and then in the warmer climate of the lower altitudes came the sages. After leaving San Bernardino the train passed through much waste country—thousands of acres, apparently, which was unfit for cultivation owing to the vast quantities of rocks which covered it. In among these rocks the white sage grew thicker than I ever saw it elsewhere. There were no apiaries in sight from the train, but surely there are many located where there is such a grand field for bees. Up near the top of the range above San Bernardino some bee-man had an apiary of several hundred colonies located about fifty feet from the railroad track. I felt envious of him when I thought what little trouble he was put to in getting his honey aboard cars, in comparison with myself who have to haul fourteen miles over the worst of roads.

From what I can hear, apiaries located at high altitudes are more sure of a crop than those located in the valleys where the sages thrive. It is probably owing to the greater rainfall which takes place among the mountains. Sometimes there are heavy rains in the mountains, when the valleys and foot-hills do not get a drop. The honey, after getting above the sage-line, is generally dark. The season, too, is later, which makes it practicable for the valley bee-men to practice migratory bee-keeping. Two years ago, after the honey-flow in my locality had entirely ceased, two mountain apiarists came to my place to purchase some foundation. Their bees were swarming, and storing in sections quantities of honey which they gathered from milkweed. I subsequently heard that their crop was a good one. Now, in a straight line their location was only some fifteen miles from mine, and in that vicinity was plenty of unoccupied territory. Had there been a wagon-road to their locality, instead of merely a very rough mountain trail, I could have moved a couple of hundred of my best stocks over there and made a big profit by so doing. Even this season, which has been so generally bad for the foot-hill bee-keepers, has, I understand, been a good one for the apiarists located in the Tehatchipi Mountains, a district in which there is plenty of snow during the winter time.

Bees are now working on goldenrod — that is, where they can find any to work on, for it is a very scarce plant with us. I am unable to ascertain why it is so scarce. I find it in small patches at both high and low altitudes, on clay and on sandy soil, seeming to prosper everywhere. It is nowhere plentiful. The alder-trees along the creeks have furnished a generous supply of honey-dew. It will come in very handy for those apiarists whose bees have not gathered enough honey the past season for their own subsistence.

The mesquite, which Arizona apiarists praise so highly as a honey-plant, is very abundant near Needles, along the Colorado River. There are no bees in that vicinity, and it is doubtful whether they could exist there, as the country on each side of the river is a desert, and, with the exception of cottonwood-trees along the river, there is nothing growing which would furnish honey except the mesquite. It would be a hard matter, too, to keep the combs from melting down, as the mercury sometimes registers there 128° Fahr. in the shade, and 115° at midnight is not unusual. The boundless desert by which the place is surrounded is, no doubt, responsible for such extreme heat—a desert in size as large as New Jersey; and, unless there are minerals on it, the whole of it not worth a bunch of wooden toothpicks. It is probably here that most of those queens die which arrive from the east.

In a section like this, where new comers are constantly engaging in the bee-business, and old hands starting out-apiaries, the matter as to the rights of prior locators on a range assumes importance. Some of the bee-men hold that he who first gets possession of a range has rights which others should respect. Some locate wherever they think it will be profitable for them, and it is on that matter of profit that the whole question hinges. "Self-preservation is the first law of nature;" therefore if a man finds that he can make a greater profit by entering into competition on a good bee-range than by going to some poor but unoccupied range, it is his duty to himself and family to do so. I can not see why a bee-keeper should be more exempt from competition than a merchant. A store-keeper who, because of prior location in a village, should protest against another's starting there would be laughed at. The bee-keeper who desires to possess in entirety a range can best do so by so stocking it with bees that any experienced person can see that it is unwise (that is, unprofitable) to locate there. An inexperienced person generally manages so badly that what little honey he gets makes no difference in the other's crop; and when located near an expert they are generally crowded out after a year or two.

If I wished to start another apiary I would get an unoccupied range if I could; but, failing in that, I would locate near the most ignorant and indolent bee-keeper I could find—some fellow who, occupying a range capable of giving fifteen or twenty tons in a good season, never gets more than from two to four tons. The successful apiarist had better make up his mind at once to be crowded, as the unsuccessful ones will never attribute his big crops to superior brains, but to a superior range, and will move their bees in to share with him.

William G. Hewes.

Newhall, Cal., Oct. 5, 1892.

[You have presented to us another view; and while a store-keeper has no reasonable right to object to another coming and setting up in the same line of business, it is possible that also a *bee-keeper* first in the field has no right to object to another locating an apiary on the same territory. But are the two cases altogether parallel? Somehow, if we had gone into a locality, and had demonstrated that it was a grand location for bees, and with that field had secured large crops of honey, we think we should be somewhat mad if some other chap should come and locate with, say, a hundred colonies within half a mile of us and cut down our yields by one-half. The other fellow would, in all probability, not have located there in the first place had he not seen we were making money. Some moral right is due bee-man No. 1 for discovering for himself a good field.

This is a hard question to settle, and, in all probability, you will hear from Dr. Miller on the other side. Of course, there is no *law* whereby the bee-keeper first in the field could secure the privilege of that field all to himself. The only thing he could do (and that is out of the question) would be to buy up, say, five thousand acres and allow no other bee-keeper to occupy that land. He then has a proprietary right to the whole field. Five thousand acres would give a bee-flight of about a mile and a half. Unless the bee-keeper has unbounded faith in his locality he can not afford to pay even 50 cents an acre. The matter as at present adjusted is a case of the survival of the fittest, as you intimate. The one who is the best bee-keeper will crowd the hardest, and at last crowd the other man out entirely. Perhaps this is right.]

THE RIGHT KIND OF ABSORBENTS.

GROUND CORNCOBS.

Much has been said pro and con about absorbents versus oilcloth for winter covering for bees. With many, absorbents and upward ventilation seem to be synonymous terms, and that, if oilcloth be not used, upward ventilation is the result. This is a mistake. With chaff cushions, I will admit, you have more upward escape of air than is good; the chaff is too light, too cellular, and not porous enough. You want a heavy, denser substance than chaff—one with more *capillary force* that will transmit the largest amount of moisture with a minimum amount of heat. Air is the vehicle that carries both moisture and heat, and the medium which will transmit the largest amount of the former and the least amount of the latter is the best.

After experimenting with various substances the well-known absorbent power of corncobs induced me to try them, using them whole and filling the interstices with dry fine sawdust, which answered very well. Afterward I had them ground at a feed-mill, and filled the boxes three inches with this meal, and I want nothing else. Cobs chopped and mixed with dry sawdust do well. This is practically a non-conductor of heat, and it is dense and porous, and has the capillary force—like blotting-paper—to carry moisture to the outer atmosphere. To illustrate this capillary force, suppose we build a new hive from lumber sawed transversely four inches thick—sides, ends, and cover, joints hermetically sealed. This would certainly be a warm hive, and, with the capillaries or pores of the lumber directed from within outward you would never find a drop of water condensed on the inside as long as the temperature within was above freezing, and the surface free from propolis. Bees in their natural homes have the benefit of this capillary force.

You say in the May issue that bees seem to get along and build up better in the spring with the oilcloth covering. That is undoubtedly so, and for the simple reason that, at that time, they need the water that is condensed on the under surface for their brood, which they for many days at a time are unable to go outside and get. At this season the absorbents should be removed and the oilcloth substituted.

Washington, Ind., Oct. 10. J. A. SCUDDER.

RAMBLE NO. 70.

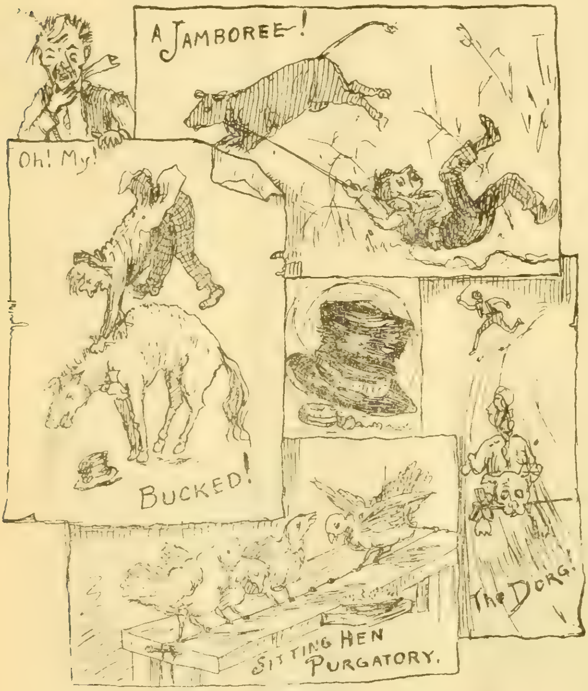
RAMBLER'S EXPERIENCE IN LIVING ON A RANCH ALONE.

I believe I have had occasion to remark, that even those bee-keepers who live an isolated and lonely life are generally quite fraternal. If you happen to drop in upon them from the outside world, and have any news to tell, or reading-matter to dispose of, it is eagerly sought. In some corner of the cabin will be found a few books, standard works, both poetry and prose, and perhaps the walls are adorned with prints from the illustrated papers. A very good idea of the character of the man can be obtained, sometimes, at a glance. In the cabin of a lone dweller of the mountains I found a great array of flashy pictures and clippings from the *Police Gazette*, and it needed no words to reveal the condition of the occupant's mind. In another cabin, though the owner was living there only occasionally, several copies of the *Free Thinker* and kindred papers were found, giving an unmistakable indication as to his belief. But whatever a man's belief, he will seldom bore a stranger with it; and of all countries this is one of the greatest in the spirit of toleration for a man's opinions and method of life, and it is well that it is so.

OFF FOR THE SEASHORE.

Although Mr. Clark (mentioned in Ramble 69) is a benedict he is full of that fraternal spirit, and stands not upon ceremony in the limitations of distance and previous acquaintance as to his neighborly feelings. I have known this to be the case when we have traveled together around the mountain, or far over the plain; and I soon learned that, when he wished "to talk with that man just a minute," and left me in possession of the wagon, the minute lengthened out inordinately. In all such cases I was very thankful to have with me my long-wind Waterbury watch; and as the minutes lengthened I would commence to wind, and usually complete the job upon Mr. C.'s return. While waiting at one place I varied the exercise by making an inventory of what I saw in a bedroom. Of course, the bedroom was a detached building, but had in it two beds, a work-bench with tools, and a good supply of bee-hive material, several bags of Egyptian corn, with evidences of mouse work; a shoemakers's bench, wire netting, shovels, rocking-chair, wagon-wheel, manure-fork, six chains, ropes, boots and shoes, wire, tin cans, and other things too numerous to mention. The occupants of the beds seemed to be haggard and worn. One was on the bed and another on a box. It was evident that their surroundings were admirably fitted to give them an overdose of the nightmare.

Though Mr. C., while on our trips, would have several of these *minute* talks, and spend considerable neighborly time helping those afflicted with balky horses, we usually made the home ranch by chore time. This humdrum of ranch life I noticed was having a depressing effect upon Mr. C., while Mrs. Clark was completely prostrated. It was of prime necessity that they should go to the seashore for their health; and in order that they might go, the Rambler consented to stay during their two weeks' absence, and care for the ranch. Mr. Wilder was off again in the mountains, and his pony and colt needed a master, and all of our apiaries needed a little looking to. Then there were bands and bands of quail that needed to be put on toast. I knew the two weeks could be well put in, and was not at all lonesome when I saw the big covered wagon drawn by three horses depart with camping and gastronomic outfit, and, with them, four of the young men and maidens from Bloomington. My animate companions were 170 swarms of bees, 100 hens, a cow, heifer, a spotted yearling; Ben, the white dog, a trio of cats, and a double-barreled shotgun, the latter to aid in preparing the quail for market.



A JAMBOREE!
Oh! My!
BUCKED!
SITTING HEN PURGATORY.
The DOG.

RAMBLER'S EXPERIENCE ON THE RANCH.

As to how I enjoyed myself and kept dull care away will be better understood by giving you a letter I sent to Mr. Clark after I had managed things for a week:

Mr. W. E. Clark,

My Dear Sir: Agreeably to promise I would inform you that I am still in the land of the living, and still clinging to your ranch. It is the same with all of your domestic critters, except that old brown hen with a lop-sided red peduncle on the top of her head. She was asphyxiated during a sandstorm that howled around here; but, don't mourn over the old hen; there has been a large increase in the hen family. Ten remarkably healthy chickens have been hatched, and are doing well. Since you went away I have put seven hens in purgatory on short rations—they wanted to sit.

The big tank of water lasted until Sunday, when Mr. S. came over and I drew up 240 gallons. I knew something would happen, and, sure enough, one of his horses kicked and broke a tug, and the very next day some animal rubbed around the faucet and let off the whole 240 gallons. I laid it to the dog, and got the shotgun to execute him; but evidence being wholly circumstantial, and the water having been placed there in violation of the moral law, I submitted to Providence and reprieved the dog. I irrigated the cattle for three days by leading them to the spring. It takes 15 gallons of water to irrigate one full-grown cow for one hot day. The weather is a trifle hot—98° in the shade.

Mr. Clark, I don't know that you know it, but that spotted yearling of yours is afflicted with the jamborees. It jamboreed me across your cornfield head first, scooped a peck of dirt down my back, and lost my Waterbury watch. I now lead the cattle with a long rope; have blood in my eye, and the shotgun in hand.

The bees are gathering a great amount of water on these hot days. They rob out half a barrel of it regularly.

Wilder's gentle pony also served me a diry trick. I tried riding her to the picket rope without a halter. She ran and bucked and rebucked, and bucked again, giving a fellow a flying-all-to-pieces sensation. I alighted quick, and sat down in the sand to collect my physiology. I now use a bridle.

I hope this will find you improving in health. Don't hurry home on my account. Every thing is lovely, and I'll stick to the ranch if it busts. I found my Waterbury. Yours, etc.,

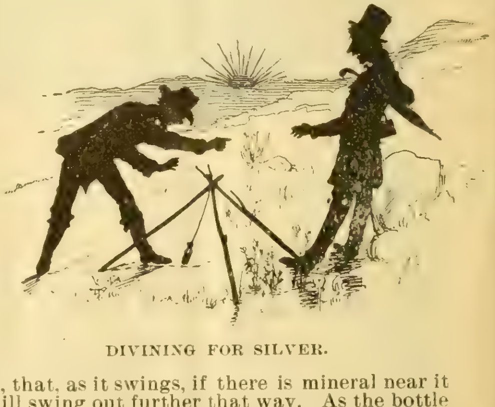
RAMBLER.

P. S.—I haven't made any butter yet; couldn't find the skimmer. Send me word where it is. R.

P. S. No. 2.—*Later.*—Never mind the skimmer. The dog ran off with the churn-dasher. Dog and I will take care of the cream. Don't hurry home. R.

Along with my other entertainments I would have an occasional caller, a wayfarer who had, perhaps, lost his way on what he would call a desert. One sturdy Dutchman, with a donkey, strengthened the word "desert" by prefixing "mill-dam" without the "mill."

My neighbor S., who kept my water-tank replenished, found a stone one day which he called silver ore, and in a few days he came over again with a divining-instrument to locate the vein. Fortune-tellers and spiritualists had told him that he was going to strike a rich mine, and he was full of faith. The instrument was an ounce bottle filled nearly full of brick-red substance, the main ingredient being quicksilver. After climbing to the vicinity of the supposed vein, Mr. S., nearly out of breath, remarked: "Say! it tires a feller right smart to climb up hyar." A tripod was made by tying the ends of three laths together. The bottle was suspended like a plummet. After bringing it to a dead rest it soon began to swing to and fro. The philosophy of the thing is, that, as it swings, if there is mineral near it will swing out further that way. As the bottle swayed more and more, Mr. S. loudly exclaimed, "Thar she draws! she draws that way. There's



DIVINING FOR SILVER.

rich mineral here somewhar. Why! an old prospector might tramp around hyar a thousand years and never find a bit of ore, while we might stumble right on to it. Don't yer see?"

After trying the divining-machine in several places the wind began to interfere with operations, and the discovery of the mine was postponed indefinitely. While Mr. S. could see it swing one way more than the other, I could not. It was a clear case of faith, and a lack of it.

There are many in California who think they may stumble upon untold wealth, and still plod through all their lives and never find it. The bright dreams and anticipations of finding it are probably as pleasurable as the attainment of the substance itself.

Our friends returned safely from their camping and bathing tour on schedule time, much invigorated in body and spirits, and ready for the further duties of ranch life. Feeling a desire to rest from the two weeks of ranch life, I retired with the pony to the quiet recesses of Wilder Canyon; and in that lonely place these lines are written by the RAMBLER.

ADULTERATION OF HONEY.

SOMETHING FROM MR. LANGSTROTH.

Friend Root:—It begins to look as though we had nearly got to bed-rock on the adulteration question. Our good friend Prof. Cook has done a very great service to all honest producers of and dealers in pure honey. As you say, "If it is indeed true that glucose adulteration can be easily detected, it is a grim fact that will make evil-doers tremble." I fully indorse what Prof. Cook says. "We know that honey is largely adulterated; but almost always, if not always, by feeding* glucose. This can be detected. Thus we can successfully fight this evil. Prof. Wiley will help us. Let us declare the battle on."

Yes, let us declare the battle on; and if we march under the banner of the Bee-keepers' Union we may expect that, in due time, the victory over *glucose* will be won.

I believe that you are safe in saying, "Practically, then, glucose is the only article that can be used as an adulterant, *at a profit.* You say, further, "Sugar may possibly be used, but we doubt it." Now, if either pure sugar syrup, of light color, or *any mixture* of this grade of syrup with the highest grades of honey should be *fed* to bees to have them produce a choice quality of comb honey for the market, it matters nothing, even if chemists should be unable to detect this product from honey entirely gathered by the bees. Without entering into particulars, it is enough to say that all experience shows that *nothing can be profitably fed to bees*, to be worked up into choice comb honey. I know that it has been suggested that a profit might be made by emptying choice sections of white-clover honey, and then inducing the bees to fill them with a cheaper substitute; but if glucose has been used in the process, detection is sure; and without, there will be no margin left for profit. Dark grades of liquid honey are too cheap to make it worth while to sugar them. Prof. Cook shows how we could feed our bees a syrup made of, say, one-third honey and two-thirds cane syrup, and the chemists could not detect it; nor could the consumer; but as it will not *pay* to do this, it will not be done.

There is still a question which I wish to submit to our friend Prof. Cook: Suppose that one-third choice extracted honey, say white clover or linden, be mixed with two-thirds choice white-sugar syrup, and the bees allowed to do nothing to the mixture, can the chemist or consumer detect the difference between this mixture and the pure liquid honey? Why this question is asked will be better understood if I quote from the first edition of my work, "The Hive and Honey-bee," published in the spring of 1853, pages 336, 337:

> Dissolve two pounds of the purest white sugar in as much hot water as will be just necessary to reduce it to a syrup; take one pound of the nicest white-clover honey (any other light-colored honey of good flavor will answer), and, after warming it, add it to the sugar syrup, and stir the contents. When cool, this compound will be pronounced, even by the best judges of honey, to be one of the most luscious articles which they ever tasted, and will be, by almost every one, preferred to the unmixed honey. Refined loaf sugar is a perfectly pure and inodorous sweet; and one pound of honey will communicate the honey flavor in high perfection to twice that quantity of sugar; while the new article will be destitute of that smarting taste which honey alone so often has. . . . If desired, any kind of flavor may be given to the manufactured article; thus it may be made to resemble in fragrance the classic honey of Mount Hymettus, or it may have the flavor of the orange-groves, or the delicate fragrance of beds of roses washed with dew.

While those who choose may make this mixture for their own use, it would surely be dishonest to sell it to the public as pure honey. Dealers who wish to maintain a high character for strict integrity should sell nothing but pure honey. L. L. LANGSTROTH.

Dayton, O., Oct. 6.

[We are glad you called attention in a footnote to what is manifestly a slip of the pen from Prof. Cook. As we stated in our last issue, page 760, we do not believe that bee-keepers feed glucose, although just one and only one case of the kind has come to our knowledge. Referring to the mixture of sugar and honey, described in the extract from your book, we are afraid we shall be treading on dangerous ground if we give any sort of countenance to it. In the first place, we do not believe that such a mixture would be profitable. Sugar is coming up, as you are well aware, in obedience to the sugar-trust. In the second place, we feel sure that we should be able to recognize sugar and honey at once by the taste, because we have already had some experience in that line. It is recommended, in some of the bee-books, to keep syrup from granulating that is to be fed to the bees for winter use, to put in a little honey. We did so last season, but not to sell it; and although we could detect a slight honey taste, a peculiar flavor of granulated-sugar syrup, such as is used on pancakes, was very easily recognized. We have no doubt that consumers would like it, but we are strongly of the opinion that they would also detect the sugar. We know perfectly well Mr. Langstroth did not reproduce the recipe simply that bee-keepers might try it nowadays, but only to ascertain whether such a mixture would be recognized as pure or mixed honey.

Aside from all other considerations, it would be very unwise, if not inimical to the sale of pure honey, for bee-keepers to put up sugar and honey as an article of sale as good and wholesome a sweet as sugar syrup is. We want no substitutes resembling honey, that will enter into competition with it. While the bee-keeper himself might be perfectly honest, and sell it for exactly what it is, a dealer less scrupulous might bottle it and sell it as pure extracted honey, leaving off, as adulterators usually do, the name of the producer. The following letter, forwarded to us by a prominent commission house in the West, will explain itself:

---

* Feeding is a slip of the pen, for Prof. Cook says, "Bee-keepers do not adulterate. Dealers wholesale dealers—do this;" but dealers do not *feed* glucose; they *use* it only for *mixing*.

> I will send you a sample of honey, and say that it is composed of pure ingredients, such as sugar, bee honey, and a few other articles, which are all pure. I have been selling it around the country here at 70 cts. a gallon. It cost quite a bit to manufacture. I sell it under the name of "artificial honey," "honey syrup." I can send it in one-gallon cans or kegs, or any way to suit the purchaser. Please state what you can give for it, and pay the freight.

For obvious reasons we leave off the name of the writer.

However honest he may be in stating the truth in regard to the ingredients of the so-called honey, we are not so sure that he would be unwilling for the dealer to sell it as pure honey. We tasted some of the stuff, and it was simply vile. If you can imagine honey-dew, sugar syrup, glucose, and a little cheap perfumery mixed together, you may get some idea of what it tasted like. We would no more set it on the table as an article of food than we would introduce into our stomachs some semi-poisonous mixtures. The house that forwarded the letter on to us, apparently thought the mixer intended in the first place to palm it off as pure honey; but in response to their inquiries he finally admitted as above that there were certain other ingredients besides the bee honey. No, it won't do to give countenance to such things.

Later.—Since writing the above, the *Bee-keepers' Review* for October has come to hand, and we notice that we differ somewhat in opinion with the editor and Prof. Cook in regard to sugar-fed honey. We know these same differences are honest differences, and it is possible that we may be wrong in our position.]

SOME THINGS ABOUT ROBBING.

DR. MILLER TELLS US UNDER WHAT CIRCUMSTANCES IT MAY BE ALLOWED.

Friend Root:—That item of your experience on page 782 is quite interesting reading, and I think you are somewhat at fault that you do not give us more of the details of your own apiary, particularly the bad things. I am glad you have learned that, under proper management, robbing is not such a dangerous thing. It is hard to know just what is the right ground to take in this respect; for few young bee-keepers, until they have had some sad experience, have any just conception of the danger connected with robbing.

I would give something to make my assistant as afraid of robbing as I am. In former years I had such a severe breaking-in that the sight and sound of a single robber when I am at work strikes me with alarm. But Emma has not had the same experience, and can work on placidly with the music of robbers about her. I say to her, "You must be very careful or the robbers will get the start of us."

"Oh! I guess not. I haven't seen any yet."

"Why, don't you see them there this very minute, right under your very nose?" and the emphasis I give is perhaps not as pleasant as it ought to be; for if there is any thing that demoralizes me it is to have robbers offer their assistance when a brood-chamber is open. So it is that it is considered not the orthodox thing to say any thing in favor of allowing bees to do the least thing in the line of robbing. Too often, however, it is the interference of the officious bee-keeper that makes most of the trouble. A weak, queenless colony is attacked; and the only thought in his mind is, that that thing must be stopped. So the hive is taken away, perhaps put in the cellar for a time, and the robbers, not finding their prey in its proper place, pounce upon the nearest hives, which, in their turn, are taken away and thus the trouble spreads.

On another occasion a similar case occurs, but the bee-keeper is in blissful ignorance of it; and the first thing—in fact, the only thing—that he knows about it is, that the hive is completely cleaned out—cleaned out several days before he noticed it. In that case no harm is done. The colony was not worth saving, and perhaps it was a good thing to have the honey transferred where it would do more good.

I very much doubt the correctness of the time-honored tradition, that, if a bee once does any thing in the line of robbing, she will never return to honest labor afterward. You know very well, that when, by reason of bad weather, the honey flow suddenly stops, care must be taken not to start robbing; and if by some carelessness it is started, and perhaps 20 pounds of honey robbed, thousands of bees being engaged in the plunder, if the next morning opens up clear and bright, honey yielding freely, every bee in the apiary will seem to be hard at work. Where are the thousands that yesterday were robbers? Don't tell me that none of them have gone back to honest ways.

Last spring the disastrous losses left a large number of hives untenanted; and the combs, numbering more than a thousand, had more or less honey in them. The fuller combs were convenient to put in colonies needing them, but a great many had only a little honey in them. What was to be done with them? They might stand as they were, but on the whole it was perhaps better that they should be emptied out. Perhaps you may remember that they were hung overhead in the cellar. Well, the door of the cellar was left open and the bees were invited to take possession. They promptly accepted the invitation.

Now, there were two things that surprised me. One was, that it took the bees so short a time to clean out those combs. Another was, that it took them so short a time to settle down quietly after they got through the job. For a half a day or a day after the honey was gone there were more or less bees searching through the cellar, and at the end of that time there was nothing in the apiary to indicate that any thing unusual had been going on.

Another thing, if you allow a section of honey to stand out, the bees will tear it all to pieces. These combs I have been telling about were not torn at all. Whether it was that they were tougher, or that the bees had so large a surface to work over, I do not know; but I am inclined to the opinion that bees do not tear old combs so badly.

When the clover harvest closed, what little there was of it, all sections were taken off. A goodly number of supers had so little done in them that the best thing was to have the bees clean them out. A somewhat large experience in trying to get bees to empty sections on or under the brood-chamber made me dissatisfied with that sort of thing. So one day a number, perhaps 15, of such supers were piled up in the cellar in such a way that not a very large number of bees could enter at a time. They were promptly cleaned out; and 24 hours after the work was finished, there was no commotion in the apiary. The same thing was repeated with a larger number, and with the same result.

Now I'll tell you what I think. If you had allowed the bees to work on those combs that you had piled up, without restricting their entrance so much, the result would have been the same, provided you did not take the combs away till after the bees had emptied them, and had got discouraged working over them. The whole matter lies just in this: If bees get to robbing you must not take away every thing they are working at, but leave them to work on that very same spot until they are satisfied that they have finished up the work themselves. Perhaps it may do to empty out a hive they are working at, providing the hive itself is left, and nothing about its appearance changed; but I think I would rather leave some comb in the hive for them to work at. I fancy I see A. I. R. shake his head when he reads this, saying, "That's dangerous. We can't be too careful about the matter of robbing, and hardly ought to publish any thing of the kind." Yet the whole truth ought to be known. I'm just as much afraid of robbers as you are; but I believe it's well to be posted on all points; and with that never-failing safeguard, the footnote, I feel sure all will be well. C. C. MILLER.

Marengo, Ill.

[We indorse every thing you say; and, like yourself, we are afraid of robbing, and only wish that our helpers regarded it with the same fear. We can not ourselves endure to have even a single robber hovering over the frames, while our helpers think nothing of it to have as many as half a dozen. To use a colloquial phrase, we have been "through the mill," and know the bad results of allowing the bees to pilfer from hive to hive. While we hold robbing in great fear, we are inclined, on the other hand, to let the bees, under *certain* circumstances, help themselves. A year ago last summer, at the Shane yard, as a result of transferring the bees on to Hoffman frames, we had a quantity of old crooked combs in home-made loose frames—too crooked to be used in new frames. Instead of transferring these we carried them a few rods from the apiary and laid them in the shade of a tree; but, mind you, we did not expose them until we had finished work in the yard. On one or two occasions we waited long enough to witness the result. The bees pounced on to the combs in a perfect storm, and speedily emptied them of every thing sweet. The next day we returned and found the apiary comparatively quiet, nor were there any dead bees at any of the entrances, as a result of previous conflict. One time, we remember very distinctly of setting a couple of combs under a tree a few rods away, while we were in the midst of our work. All at once the bees began to be cross, and to pilfer over the top of the hive. The first incoming laden bees notified those already in the hives that honey was to be had *somewhere.* As we have noticed many times before, they began to hunt around, and, very naturally, turned to the hives where we were working, because they had not yet discovered the source of honey from which the first supply was obtained. It is needless to say we stopped right then and there.

MORE ABOUT THAT STACKED-UP-HIVE FEEDING.

Now, we would by no means advise the scattering of partially filled combs a few rods from the apiary where it is located near dwelling-houses; but in out yards situated as was the one mentioned, nearly a quarter of a mile away from buildings, it may be done at times to advantage. The plan that can always be pursued safely where it is desired to empty out combs containing a little honey, is, to place them in hives stacked up two or three high, with a small entrance, as explained in our editorial on page 782. While these stacks of hives, we know by experience, *can* be placed right near the driveway, and yet horses and persons can go by without the least interference, we would not recommend it.

This plan of feeding creates an artificial condition of things during a dearth of honey—that is, a dearth from natural sources—much like that when honey is coming in freely from the flowers in nature's own way. Instead of robbers flying around and stealing, they are given something to do; and the result is, that we have been able, during the past few days, to go on with our work of uniting, etc., in the apiary, with very little interference from robbers. And, again, we observe the honey itself is being distributed throughout the apiary, not, as we should naturally suppose, in the strongest colonies, but with a very fair and even distribution throughout all the hives. Our Mr. Spafford said that he could see the result of this open air feeding in the hives. Queens were beginning to breed, and every thing was going on just as if nature had taken a sudden boom. Nearly every apiarist every spring has a few combs containing a little honey; and what a good effect this kind of outdoor feeding may have in stimulating brood-rearing at the time of year we most desire it, with so little labor, the reader can figure out for himself. Besides the increased amount of brood-rearing, he will have a lot of nice clean dry combs, no more tempting to robbers later on in the season.

We are sure that bee-keepers have not yet experienced the many advantages that may accrue from this kind of feeding. They have known of it, it is true, but have not as yet utilized it. Now, doctor, while we may be at fault for not giving more details of the work in our own apiary, we hope we have redeemed ourselves, at least temporarily.

P. S.—A. I. R. has witnessed the results of this stacked-hive feeding *a la* Miller, and acknowledges that it is a success in more ways than one. At first he felt a little skeptical about it, and was slightly alarmed lest we "boys" might be getting ourselves into trouble.]

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

BRITISH BEE-KEEPERS AND THE WORLD'S FAIR AT CHICAGO IN 1893.

As will be gathered from a perusal of the proceedings reported in this issue, the interesting discussion which took place at the monthly meeting of the British Bee-keepers' Association on Wednesday last, on the subject of sending an exhibit of British honey to Chicago, resulted in a unanimous resolve on the part of the Association to take immediate steps for putting the project into practical shape. To do this, it is obviously necessary to secure the cordial co-operation, and, we trust, willing assistance, of bee-keepers themselves.

Had the season of 1892 been a thoroughly good one, with abundance of honey in the homes of all who keep bees in the United Kingdom, little difficulty would have been experienced in getting together an exhibit of a couple of tons of nectar as a "sample" of what our islands yield; but, unfortunately, the results have at best been only moderate, and in consequence the field on which we have to work is considerably reduced, and the enthusiasm, which otherwise would have been aroused, proportionately lessened. However, the committee, in order to meet this difficulty, have hit upon a plan by which a good show of honey may be secured without taxing either the pockets or the (bee) patriotism of our bee-keepers to any but a very small extent.

Without pledging ourselves to exact details, it may be said that, in substance, the plan is to invite contributions of honey—good, of course—in quantities of five pounds and upward, to be forwarded in bulk or otherwise to a depot at a given center (probably Liverpool, as the port of departure), where it will be received by representatives of the B. B. K. A., for bottling, package, and transhipment to Chicago. An important point to be borne in mind by gentlemen interested in the project is, that the honey sent *need not be the product of the exhibitor's own bees;* the only proviso being that the locality in which the honey is gathered must be stated, so that many who would have sent their own honey in a good season will, by purchasing from those less able to give away their produce, be enabled to further the scheme at a very small cost. Further, the name of each donor will appear on his portion of the exhibit.

Seeing that an opportunity of staging British honey alongside that of other countries, in so prominent a manner as the Chicago Exhibition offers, is not likely to occur again in our generation, we hope that our readers—with whom the matter may be said to entirely rest—will rise to the occasion and lose no time in making known to the secretary of the B. B. K. A., or to ourselves, the extent to which they are willing to assist. The exhibit will, no doubt, be seen by several millions of persons of all nationalities; it also goes without saying, that American bee-keepers will welcome a good display from the mother country; and as all cost and trouble connected with it will, as already stated, be borne by the B. B. K. A., we trust to hear without delay from intending donors, in order that an approximate idea may be arrived at with regard to the amount of space to be applied for. Preliminary inquiries may be addressed to this office, or to the Secretary of the B. B. K. A., at Kings Langley.—*British Bee Journal*, Sept. 29.

A LITTLE FOUR-YEAR-OLD DAUGHTER OF MRS. JENNIE ATCHLEY WHO CAN CAGE BEES AND QUEEN IN A MAILING-CAGE.

I must tell you of a visitor. It was a little wee tot of a four-year-old baby girl who came to see me not long since. She astonished all in the apiary by coming up to where I was caging queens. She took hold of a cage, and, almost too fast for the eye to perceive what was going on, caged the bees and queen. I learned from her how to put the bees in a cage; but we just had to console ourselves by considering the source whence she came. She was a daughter of Mrs. Jennie Atchley. W. R. Graham.

Greerville, Texas, Oct. 8.

[Well done! If Mrs. Atchley will send a picture of the little girl we will introduce her to our readers.]

WHY DO THE BEES KILL MEMBERS OF THEIR OWN FAMILY?

Prof. Cook:—I mailed you some dead bees from a colony that kills numbers of their own family. I asked Bro. Root, of Medina, about them. He says that I must be mistaken—that they must be drones, referring me to the A B C. What do you think is wrong with them? The colony is strong, active, and has lots of stores. I am positive they are not robbers, as I have only one colony of blacks or hybrids, as they are. All my other colonies are pure Italians, or nearly so, and can easily be distinguished from this. This is why I send from this colony for examination. My Italians act the same way. They pull them down from the combs, and drag them out in the same manner as they do the drones, but they sting, very nearly all of them, which they do not always do with drones, as they often carry out drones and let them look out for themselves, guarding their entrance well, and not permitting them to enter. But the samples I send you are nearly all killed by the bees themselves. I wish you would examine samples, and give result through Gleanings. J. M. Fisher.

Reading, Pa., Oct. 3.

[Prof. Cook replies:]

These bees seem very small. I presume that they are ailing in some way, and so are rejected. Such bees should be fully studied by a competent bacteriologist. He, perhaps, could show cause. A. J. Cook.

TWO GOOD POINTS IN FAVOR OF THE NARROWER SECTION.

This question came up twice at our State convention, but no discussion on the subject was made. Eugene Secor thought that wide sections are not capped over as soon when nearly two inches thick—a thing of considerable importance—while W. C. Frazier felt quite sure that eight to the foot would be the nearest right. D. Benton, my neighbor, uses seven to the foot, and I feel sure that his sections are capped sooner than mine, which are 1⅞ inch, and do not stand so much in need of separators as do mine; and if sections were eight to the foot would they not be built much straighter, and be ripe and capped nearly as soon as built? To be sure, if full sheets of foundation were used this would be one point against these very narrow sections. I think that quite good combs might be built in them by using starters only; but I presume that the untasty drone comb would, with the latter plan, be built. The grocers here will pay only 10 cts. apiece for sections of comb honey; and if they were built eight to the foot then we could sell our honey at home at a fair profit—about as good as 15 cts. per lb. I know it has been claimed that it would not be an honest pound; neither are 1⅞ sections an honest pound; and I can see no dishonest act about selling sections by the piece. I have spent much thought on this matter, and I hardly know which would be best for us. Frank Coverdale.

Welton, Ia., Oct. 11.

[We can't discover that there is any cheating when honey is sold by the section. If you can get more money for narrower sections, use them.]

A GOOD SEASON FOR BEES.

This has been a good season for bees in this vicinity, where they have had the necessary care and attention that bees have got to have to make a success with them. Our principal honey-flow has been from basswood and buckwheat, some from goldenrod and other wild flowers. I have managed my bees for increase and comb honey. I had four swarms in the spring. Three were quite weak. I now have 12 strong swarms, and have taken off 350 lbs. of comb honey. The honey season was over here Sept. 15. R. S. Noddins.

Fenwick, Mich., Oct. 12.

BEES NEVER IN BETTER SHAPE FOR FALL.

There has been no frost to kill flowers yet, and bees are still making their living. They have never been in better shape to winter than they are this fall. Hives are full of good thick well-sealed honey, and plenty of young bees are hatching now, and some of the queens are still laying. I got a fair crop of honey, and fine as to quality, mostly extracted. I have been in this State ten years, and this is the first fall that has been worked after Sept. 20, and some swarms are now killing drones that have been raised lately. WM. URIE.

Minneapolis, Minn., Oct. 10.

A GOOD FLOW OF HONEY.

I started the winter with 95 colonies. I had to feed $30.00 worth of sugar to provision them for winter. This I did not do until the last of September—too late for brood raising. What little honey they had was honey dew. Only five died through the winter, and they were queenless. The first of April I had 89 colonies. The weather was very unfavorable—wet and cold up to the middle of June. At this date I had only 43, and half of them furnished no surplus. I increased to 70 by artificial swarming, and took 1100 lbs., mostly extracted, gathered largely from alsike clover—as fine honey as I ever took. I have 1000 lbs. ready to take, of fall honey; and if frost keeps off this month I shall get another thousand from not more than 25, spring count, so I am not discouraged. There is as good a flow now, Oct. 10, as I ever saw, largely from heartsease and Spanish needle. Bees are building comb almost as well as earlier in the season. There will be no discount in wintering this winter. They are raising plenty of brood. I had a swarm some three weeks ago.

ALSIKE AND PEAVINE CLOVER.

I had made up my mind one of our dry summers, that peavine clover is the best of honey-plants; but this year bees did not work on it at all, while alsike was good. It did not commence blooming until the middle of June.

New Sharon, Ia., Oct. 10. GEORGE BRIGGS.

OURSELVES AND OUR NEIGHBORS.

Prove all things; hold fast that which is good.—I. THESS. 5:21.

A few days ago one of our readers mailed me a paper entitled the *Michigan Messenger*, extra. It comes from Adrian, Mich., and is dated Sept. 17, 1892. He wrote me at the same time, that, if I would just read St. John's speech in said paper, he would be very much gratified. I have read it, and I am very glad he sent it to me. I wish every man and woman in the United States could read it. It may be that the statements that St. John makes are not all true: it may also be that some of them are misleading; but for all that, I wish everybody might read it. But I propose to consider only one small part of it; and while I consider it, I feel how utterly unable I am to handle such matters. I know I am ignorant of politics; and I have been blamed, and it seems to me I have been somewhat abused because I am ignorant and confess my ignorance. Gently, dear friends. A lady of my acquaintance once took our good pastor to task (she did it very mildly, of course) because he did not preach *temperance* more strongly. He replied that God called him to preach Christ Jesus, and not to preach temperance particularly, and this I wish to make as one plea for my ignorance. I feel that God has called *me* to preach (in my own way) Christ Jesus. I am well aware, when I say this, that I have done it but poorly and imperfectly. I have wandered from the dear Savior more than once. May he give me grace and strength that I may not wander from his dear name when I speak to you to day. Another thing, I have not the physical strength to read and study up matters of government and state. My nervous strength for mental work even now is limited. Daily and hourly I must decide what has the greatest call on this remaining strength. I can read but little compared with what I used to read in former years. In view of this, what should I read next to my Bible? God surely calls upon me to keep posted, at least to some extent, in regard to matters of government. I love my native land. I am proud of our great republic, even with its grievous faults and failings; and when these faults and failings are held up to my face, so to speak, what can *I* do to bring about a better state of affairs? I can trust in God, and I can ask him to direct me; and then I mean to follow that direction so far as my strength and wisdom will permit. Now, dear friends, after I have done this, please do not complain. You may *suggest* to me, if you choose, that, from *your* point of view, I am not voting as I am praying; but please do not *throw* such remarks at me, and insist that I am not honest and sincere because I do not see my way clear to vote just as you do. And now for my brief extracts:

> A few months ago an old church deacon said to me, "St. John, I am redhot." I said, "Thank the Lord, deacon. I have been waiting for something to thaw you out for the last ten years. What is the matter?" Said he, "I have just learned that the government is promoting the beer business."

After reading the above, and a little further along, I confess that, for the time being, I was like the old deacon. If I wasn't "redhot," I felt desperate, if that is the right word. I was ready to stand up and declare that these things should no longer be so, no matter what it cost or what the sacrifice. There are certain crises in our lives when we almost feel justified in saying, "If this thing is going to cost us our lives, then our lives will have to go in the attempt." I felt a good deal that way at the time, and I feel a good deal that way even now. Now, here is what made the old deacon "redhot:"

> I said to the old deacon, "Yes, I think I know what you mean. You refer, no doubt, to a pamphlet recently gotten out by the Department of State, in relation to 'Malt and Beer in Spanish America;'" and he said, "Yes, I guess that is it." I said, "I know it is." I sent on and got one, and I have it here. Just listen to the title of this work, published by our government:
>
> "DEPARTMENT OF STATE AID TO BREWERS.
>
> "Malt and Beer in Spanish America." Where would you think such a document emanated from? Naturally from the brewers, wouldn't you? Yes. But let us see what it says. "Report of the consuls of the United States, in answer to a circular letter from the Department of State, in relation to malt and beer in Spanish America. Published at the public printing-office at Washington, D. C." Preachers, teachers, bummers, saloon-keepers, tramps, and thugs all chip in to foot the bills for this document. "All requests for these reports should be addressed to the Secretary of State." Let me read you the circular letter that preceded this disgraceful document:

Department of State, Washington, D. C., Dec. 15, 1889.

To the Consular Officers of the United States in Mexico, Central and South America, and the West Indies:

GENTLEMEN: Some of the leading malsters and brewers in the United States have requested the department to procure information relative to the malt and beer trade in your respective districts.

The information desired covers such points as the following:

1. The imports of malt, and whence imported; duties charged thereon; cost of same per bushel, whether imported or locally prepared, etc.
2. The imports of beer and whence imported; in bottle or wood, and duties charged thereon; kinds of beer most suitable for local consumption; detail concerning prices, wholesale and retail, of foreign and domestic beer, etc.

3. How imported malt and beer are placed on the market, etc.

The motive of this circular being the enlargement of American trade, you will not confine yourselves to the above interrogatories, which are to a large degree suggestive only, but will give as much information as possible concerning every phase of the malt and beer business, so that the malsters and brewers of the United States may fully understand the requirements necessary to successful trade in each district.

All foreign weights, measures, and money should be stated in American equivalents.

I am, gentlemen, your obedient servant,
Wm. F. Wharton,
Assistant Secretary.

Listen, citizens: I read from the report of Warner P. Sutton, one of these consuls. He says: "If the duties were reduced one-half, we could easily send in a million dollars worth of our beer."

You will notice that St. John reads the above from a government document. The date, however, is Dec. 15, 1889. I read the rest of his speech clear through anxiously, to notice whether, during the last three years that have passed, something hadn't been done to change or stop the business of extending the beer-trade in foreign lands where we are sending missionaries to preach Christ Jesus. Then, again, I reflected that we as a people have different ideas concerning the beer-trade. I supposed, however, that the government itself had only *one* idea. While in Arizona and California I asked in different places and at different times in regard to intemperance among the Indians. I was greatly rejoiced on being told there was very little of it. Saloon-keepers may sell liquors to white men, but not to Indians. The laws of the United States are terribly severe on anybody who sells intoxicating liquors to the Indians. I think my brother at Tempe told me that it was a penitentiary offense to sell an Indian a single drink. If a savage becomes intoxicated he is crazy. He knows no restraint such as a white man generally does. His old savage nature that has been under control and very quiet a few years breaks out with the fury of a mad man. It would not do at all to let Indians have access to drink as we do white men. If I am making a blunder in this, there are certainly those among our readers who can correct me. I know that I am at least partly right about it. Well, then, how is it that this same government of the United States, that has taken such pains to keep liquor from the Indians, proposes to *encourage* the very thing? You may say this scheme of sending our beer, and teaching foreigners or savages to drink, is outside of the United States—it is in *South America*. What sort of reasoning is that? Why, there is something *terribly* wrong about the management of our affairs, surely. This William F. Wharton is, I believe, Assistant Secretary of State of the United States. Perhaps I am only exposing my ignorance further and further. Never mind. Perhaps Gleanings can not give very much publicity to this document; but it can give some; and, even though its readers may be *comparatively* few, they are earnest, intelligent, and thinking men and women. I know, because I read your letters.

Some of you will tell me that the government of the United States is a peculiar institution; that it is a pretty hard matter to have it even *consistent* in all its branches and ramifications; and I presume some allowance should be made for this. Others will tell me that it is *all* corruption and greed and bribery, any way. I think I know this latter is not true. It is the best government, the most Christian government, that can be found on the face of the earth; and I believe it is the best government under which a poor man can live. If it is not, where is there a *better* one? and are people flocking to it as they are flocking to *our* shores? A great many times, when people find so much fault with our laws and law-makers, and of our government in general, I feel a good deal like saying, "Why, my good friend, if things are so *awful* bad here, why don't you go off to live in some other country, where they are honest and righteous, and upright and pure?" Well, it transpires that this government is even now pushing the beer-trade into foreign countries, right along side by side with our missionaries; and I think I have before heard it intimated that whisky, and other intoxicants to be sold to the natives, often go on the *same vessel* with the missionary. If this is true, what shall be done about it? In one sense I do not know; but when I say I do not know, of late there comes up in my mind again and again a fragment of a little hymn:

I am weak, but thou art mighty;

and we Christians know—or, at least, we *ought* to know—that one man with God on his side is more than a match for hundreds or thousands of the ungodly. The first thing to be done, then, is to be sure that God *is* on our side. Of course, God does not take sides or change sides; but if he does not, *we* do, because we are weak and human, therefore we want to be on God's side. But who shall tell us which *is* God's side and which is not? He himself will tell us by his Holy Spirit; if we seek his counsel and his aid he will certainly make it plain to us sooner or later what his wishes are; and this is a very comforting thought to me. It is not my duty to depend upon *anybody* as to what I should or should not do. "Him that cometh to me I will in nowise cast out." I wish to make another quotation. This time I am going to quote St. John himself. Here is what he says:

GOVERNMENT COMPLICITY IN THE BUSINESS

Did you ever think of it, you church people, that our government is in partnership with this business? It runs every distillery just as much as it runs the postoffice. Its officer carries the distillery key; he unlocks the building in the morning, and locks it up at night.

My impression is, that the above is rather extravagant. Well, if it is not true, that making whisky is getting to be like managing the postal department, what *is* true? I think there is some truth in it, from a little circumstance that came under my observation a year ago. One of the boys who used to work for us went to Oberlin to school, and is now principal of the schools in a small town in our State. I visited his school, and objected to a certain loose way they had in that community. Certain big boys, who looked as if they were more at home in a doggery than in a schoolroom, had a fashion of coming to school and calling themselves "visitors." The visiting was done by going and sitting by the nice-looking girls, and whispering silly things in their ears during recitation. Of course, I did not *hear* what the whispering was—I judged only by the result. As soon as school was closed I made a vehement protest. Our young superintendent said it was a "fashion" they had in that neighborhood, and it could not well be stopped without making a commotion. I pressed my point as follows:

"Why, go to the directors; state the case to them; give them your opinion in regard to the matter, and, with their sanction, let the commotion come. I would stop it or I would hand in my resignation."

"Mr. Root," said he, "if you knew the directors as well as I do, I don't think you would undertake it. The principal one is the largest owner in the government distillery right over there on the side of the hill. He is the most influential man, and is well off; but he would think this matter of the interruption of the studies so trifling that it is not worth while to make a fuss about it."

"But, my friend, the interruption of the *studies* is a small matter. If that fellow who was in here this afternoon should go and sit by a daughter of *mine*—yes, I have a girl just about the age of that one, between fourteen and fifteen—if that low-lived fellow should go and sit in the seat beside her, and whisper and look at her as he looked into that honest, childish face half an hour ago, I could hardly restrain myself from giving him a horsewhipping. If that girl's mother had seen what was going on here this very afternoon she would be like an enraged tiger, and she ought to be."

I had heard a good deal about the government distillery, their nice apparatus and beautiful building, and I walked over and took a look at it. It was not running then; in fact, it hadn't been running for some time; but I looked in through the windows, and saw the nice apparatus, the beautiful furniture, the fine building, built without regard to expense, and pondered. Such a building looked out of place in that poor little town. Near it was a neat little office. A sign over the door proclaimed it to be the office of Government Inspector of Liquors. I can not remember the rest of it. Our young superintendent had an entertainment at the close of his school, to show the proficiency of the scholars. They charged an admission fee, and he had worked hard that they might have sufficient proceeds to purchase a library for the town and school. The pupils and teachers all did their best, but they succeeded in raising only a paltry sum, say between $20 and $30. The saloon-keeper across the way made his boast that he took in over *$100;* and my young friend said there was a steady stream of men and boys from the hall where the exercises were held, across the way to the saloon, *during the whole of the exercises*, and yet this was a little town of less than a thousand inhabitants.

Now, then, friends, if St. John and I have got things wrong, will some wise, honest, kind friend set us right? I do not care what political party you belong to; and it surely does not make any difference whether you belong to the same church I do or not; but I hope that, when you attempt to set me right, you will do it without bias or prejudice. St. John says that ignorance and prejudice are the worst enemies we have to battle with. May God have the mercy, goodness, and love, to deliver us from both.

You may think I am getting discouraged and disheartened lately. No, I am not. I am full of faith in my country. My faith in God is stronger, I am sure, than it ever was before; and my faith in you, dear reader, is bright and clear. I love my fellow-men—yes, I love them while it grieves me to the heart to know that they think our institutions may be built up by sending beer and liquors to South America.

No doubt it is a good thing to get "redhot" occasionally, as the old deacon did; but we want to be sure we are right before we go ahead: we must not be in haste to think evil: but, in the language of our text, we as Christians must prove all things and hold fast to that which is good. Temperance people and Christian people often harm the very cause so dear to their hearts by want of charity and perhaps want of the virtue expressed in the little text, "Thinketh no evil." Let me illustrate: A few days ago an individual came to me and commenced something in this wise:

"Mr. Root, I presume you are not aware of the amount of liquor that is sold right here in our town, even though we have no saloons. You are *surely* not aware that a liquor-car comes to our station here every Sunday morning before daylight, bringing beer and other liquors that are hurried off to people's cellars to be afterward retailed out and divided around. And perhaps you would not believe me if I should tell you that some of your own hands—some that you regard as most faithful and trustworthy, are engaged in this work. Now, what I want is a little money to set a detective at work and to go into these people's cellars and show up to the *light of day* the iniquity that is going on here in our midst."

"But, my friend, you are surely mistaken in saying that any of *our* help is in this business, even if such a business exists."

"Indeed, I am not; and if you will consent to believe your own eyes, just get an officer of the law and see what you will find. Of course, you would not believe that your friend X and your friend Y and your friend Z were in any work of this kind. But, Mr. Root, you have yet to learn how eager these German people are to turn a penny when they think they can do it without being discovered."

Now, I think I know our Medina people pretty well; and I have always thought I knew my German helpers pretty well; but as my informant went on, the poison began to enter my heart. However, I had the good sense to insist that the thing was impossible, even while I began to think these people might be capable of such evil. I knew that a very good Christian woman lived at at least one of the places mentioned, and I suggested that surely no such proceeding could go on there without her consent or knowledge; but my informant said something like this:

"This good woman of whom you speak did at first stoutly object, and refuse to have any thing to do with it; but by and by she said less about it, then kept still, and is now as active in making money out of it as any, and even her *children* are helping."

I began saying to myself, "What an awful story of depravity is this! Surely sin and Satan *are* abroad if this thing be true." But I kept these feelings back, and simply said,

"No, I will *not* give ten nor even *five* dollars toward employing a detective. My experience with detectives has not impressed me very favorably. I will, however, go to some of these friends and get at the bottom of this matter."

"Oh! you must do no such thing; you will put them on their guard, and make it impossible for us to get any clew. I was afraid when I came to you that that was just what you would want to do."

Within a few minutes I met one of the parties mentioned. He was busy drawing dirt. When I asked him if he could stop just a minute he replied, "Oh, yes! certainly;" and as he jumped from his load and stood by my side with his frank, manly countenance, I felt ashamed of my suspicion, and felt more like asking God to forgive me that I had ever thought an honest, hard-working man like himself could be secretly engaged in the whisky-traffic. In fact, I felt so much ashamed of myself that, without touching the point at all, I said, "X, do you know what I want to talk to you about?"

He at once smiled in his straightforward, honest way, and replied, "Yes, Mr. Root, I guess I do."

"Well, X, how much truth is there in what I have just heard?"

He dropped his head just a little, and then he went on something like this:"

"Mr. Root, you know my wife has a baby, and she does not get along very well, and is not very strong. The doctor said I should get some beer for her, and I did so, and it is in my cellar. I tell you the whole truth about it."

"Very good, X. If the doctor told you to get some beer for your wife, it is your own business, and not that of anybody else, that I know of; only I think the doctor is mistaken in some of his ideas. The only thing about it that interests us is, have you sold or given away any of this beer that you got for your wife?"

"No, Mr. Root, I have not, and I am not going to."

"And you are quite willing that I should go up to your house and look through your cellar, as I have been told to do?"

"Why, to be sure, Mr. Root. We should be glad to have you come up to our house any time, and go into the cellar or anywhere else you want to go. Nothing would make us *more* glad than to have you come and see us; but please come *upstairs* too, and see the baby."

The genial, kindly good nature that beamed in his face as he spoke the last words placed him, without a doubt, *very far* higher up (even with his beer for his wife and baby), than the person who had tried to poison my mind by telling me these false and wicked stories.

"Look here, X, have you any idea why this person should come to me with such a string of falsehoods as this?"

"Why, yes. We had trouble about building a sidewalk. She threatened me, and said if I didn't do as she wanted me to she would go to *you* and get me turned off."

"And did you believe that anybody could come to me and get one of my good friends turned off when he is doing his duty as well as he knows how?"

"Why, Mr. Root, I didn't *think* you would do so; but yet it troubled me a little, after all."

One other of the three, a most careful, conscientious boy who goes regularly to Sunday-school, and tries to do right as well as he knows how, actually cried when I came to him about it. I do not know but my faithful little friend felt hurt to think that I should even *inquire* in regard to such a charge; any way, he *ought* to have felt so, and I beg his pardon from the bottom of my heart. Now, do you see the moral? "Prove all things; hold fast that which is good." When you are getting "redhot" in regard to the iniquity there is in this world, go slow. Don't be in haste to believe all that is told you. Some astounding things are said, and once or twice in my life I have heard statements from the speaker's stand that were almost as much out of the way as the story I have told; and when you hear such stories, be careful how you repeat them. Don't even tell your wife until you have first gone straight to the one who is accused; then, if nothing else can be done, hold the offender up to public gaze. I earnestly hope that this charge that our government is even *now* at the *present time* helping to push the liquor-traffic into foreign countries is a mistake. No harm can come from giving it publicity, any way, because the charge is already being made and scattered broadcast. Let us go forward hand in hand, with malice toward none and charity for all; and if it be really true, as St. John has it, that ignorance and prejudice *are* the worst foes we have to fight, let us fight ignorance and prejudice; but let us first get thoroughly *acquainted* with them. Let us visit them in their homes, that we may know whereof we speak; and then let us apply the remedy with the love of Christ Jesus in our hearts. Let us love *even our enemies* while we are full of energy and godly zeal in bringing them to justice, providing *nothing else* will turn them from the error of their ways.

HIGH-PRESSURE GARDENING.

BY A. I. ROOT.

FARMING DOESN'T PAY.

Of course, I can not undertake to go over all the reasons why farming doesn't pay at the present time; but some of them have come under my observation to such an extent that I want to speak of it. In running about the country on my wheel I am again and again forced to the conclusion that farmers, at least many of them, do not work as people do in factories or at mechanical trades. Of course, many mechanics get better prices than farmers do. If you employ a stone or brick mason he commences at 7 o'clock sharp in the morning, and works till 6 at night. He does not stop to gossip nor to tell stories—seldom to eat even an apple. He works hard, steadily, and busily, straight through the ten hours. For this service you pay him perhaps three or four dollars a day, and he ought to have it—that is, when you consider how much he has to stop on account of the weather, and how he puts in when the weather is favorable. You may say it is not right for everybody to work every day like that. Well, may be it is not; but if I were on a farm, and a mortgage were hanging over me, I think I would work just that way. Yes, I know some farmers *do* work that way, and some work hard even twelve or fourteen hours a day, and wear themselves out; but these are extremes. The great bulk and mass of farmers do nothing of the kind. A few days ago I was in a country town several miles from home, so late that it was not wise for me to think of going home on my wheel in the dark; so I stayed over night, intending to start out at the peep of dawn. But I was urged so hard to stay to breakfast that I concluded to do so. Now, this little town is a community of farmers. Almost every man in the town has a farm, more or less, back of his home. A good many of their farms are mortgaged, and there has been considerable talk at their farmers' institutes to the effect that farming does not pay. I do not think, however, that very many of them have got where they talk of repudiating their debts; but it seemed to me there were quite a good many who have not very much energy nor ambition in lifting the mortgages. I got up a little later than my usual time. As nobody was stirring I took my wheel and ran around the town some. The weather was beautiful, and, in fact, it was one of these beautiful October days we are just now having. The roads were hard and firm. Our own big team has been drawing two tons and a half of coal at a load, right along, because the roads are so nice and the weather so favorable. It was just the time for farmers to be out and moving as soon as they could see. Yes, if I were going to lift a mortgage (come to think of it, that is exactly what I *am* doing) I think I should have my breakfast long before the sun is up, and, under some circumstances, even before real broad daylight. Well, while I was waiting for people to get up I thought I would run around the town and look at the homes. How many people do you suppose I found moving as I went past say thirty or forty neat and tidy homes, little and big? I do not know just what the hour was, but it was between six and seven. I caught a glimpse of only two individuals—a woman and a boy. As I did not see any smoke coming out of the chimneys I concluded their getting-up time was generally about 7 o'clock. Some of them—I do not know how many—finished their breakfast about 8 o'clock. On another occasion I visited one of our country towns, starting after breakfast, rode 12 miles, and found the man I wanted to see, just getting up from the breakfast-table. Perhaps he has no mortgage to lift, so it is his own business. But in going about the country as I have been doing lately (and I think I never circulated among "our homes" and "our neighbors" in all my life as I have of late) it has seemed to me as if a great part of the farmers seemed to think it vacation time, or they are off at a summer resort; or that, during the month of October, *every* day is *Sunday*. No doubt farmers suffer many wrongs that ought to be righted; but I am sure it is also true that they do not put in as many hours of good steady hard work—or, at least, a great many of them—as do our masons, our carpenters, or those who work in factories where they are working for wages. This matter of stopping to talk and visit, and talking politics, is, I am sure, *often* carried to too great lengths. My conscience would trouble me if *I* were to do it. I believe in being sociable, and perhaps I need to cultivate this very virtue; but my conscience would trouble me, if my crops were suffering, if I should stop to visit when the weather is so favorable. May be these friends had no crops that were suffering; but I tell you the thrifty farmer *always* has work that is crowding when the weather is nice.

Let me give you just two pictures that have lately come under my eye. One day a train was obliged to stop on a side-track. I felt as if it were wicked to waste my time, so I strayed across the lots into a barnyard. The proprietor declared that farming didn't pay. I looked into a hen-roost near by, and the manure was piled up almost to the perches. There were great wagon-loads of poultry manure that had probably been there for years. I could *never* stand it to stay on a farm—I should be homesick and disgusted—if I were obliged to stay amid such surroundings as I saw that morning. I exhorted him somewhat about his poultry manure, but he had no heart nor energy for any thing—the business did not pay.

Now for picture second: Yesterday a man brought me a load of Hubbard squashes. They are scarce this year, and I told him I would give him 2 cts. a pound for some nice ones. I paid him $7.61 for what he had on his light spring buggy. Then he informed me that they grew on *four square rods* of ground - just *one-fortieth* of an acre. I asked him what fertilizer or manure he used. He said he did not use *any;* but I thought I saw a sort of twinkle in his eye. Then a neighbor let out the secret. He cleaned out an old poultry-house—no, no!—"chicken-roost" I mean—and he got so much manure he did not know what to do with it: so he spread it out on the four rods of ground. He worked it in after a fashion, and planted potatoes. The ground was too rich, and he did not get any crop. Last spring he plowed up the same ground very thoroughly, so as to get more dirt mingled in with the manure, and then planted potatoes *again*. Somebody told him if Hubbard squashes were planted among potatoes the bugs would not bother them. So he put a squash seed in every other hill of every other row of those potatoes. Sure enough, those bugs never touched those squashes. Do you know why? I do, if you do not: and I can imagine every bug going off holding its nose in disgust, because of that poultry manure, strong enough to sicken an ox, to say nothing about a tiny little bug. Did this manure come from the same roost I looked at? Well, perhaps not; but it was off in the same direction, and the moral is just the same, any way. I do not know how much the man got for the potatoes on that four rods of ground. I understood there was a good crop, and that the squashes did not hurt the potatoes a speck, and *vice versa*. Of *course*, they didn't. You can grow two crops on the same ground, without a *bit of trouble*, if there is food enough for both. I am not sure but that the shading from the hot sun was a *benefit* to both. Did you ever notice how things grow when they have got so large as to cover entirely and *shade* the ground? Well, here is an instance of two crops grown on the same ground. *One* of the crops yielded at the rate of *$304.40* per acre. Returns from the *other* have not yet come in. Is there not a little bit of daylight leaking through the clouds when we consider the facts brought out in the above little story?

You may ask why I am buying Hubbard squashes and paying 2 cts. a pound for them. Well, *I* have been backsliding. My creek-bottom land was under water so much I decided to put the squashes up by the windmill; and I put them on a piece of ground that I have owned for only a little over a year. It is underdrained, but it has not yet been manured up to the highest notch; so, instead of getting squashes by the ton, I got how many? One good big *wheelbarrow-load!* I thought once that I too would quit farming because it did not pay; but since it leaked out how that man raised his great crop of Hubbard squashes, I think I shall gather courage and *keep on farming*.

MARKET-GARDENING FOR NOVEMBER.

Even during this poor season we have occasional glimpses in the way of pleasant surprises. We are just now selling the finest Snowball cauliflower we ever raised. I think the seed was sown about the 1st of July. While heading up, the weather has been so cold that we have had no trouble from the green cabbage-worm, nor from insects of any sort. And another thing, we took pains to tie the leaves up in a bunch over the heads, just as they were heading out. The seed is exactly the same, namely, March's Snowball cauliflower, that gave us in the spring sprangly, sprawling heads, scarcely fit for any thing. They are now compact, nice, and more like a great snowball than any thing else. As we get from 10 to 15 cts. a pound for them, some of them bring 25 cents a head, and I guess there are 100 nice heads on four rows, each perhaps 50 feet long. We also had four rows of carrots, one foot apart, rows about 400 feet long. The wetness drowned them out so many times that there was not more than half a stand. Notwithstanding, we have about 30 bushels of carrots. Where the plants were not drowned out, they are so thick that they have crowded each other out of the ground; and in some places almost a peck of carrots would come out in a lump, some of them so large as to weigh five pounds. We have just sold 25 bushels at forty cents per bushel. At this rate the carrots would give us a crop worth about $400 an acre. The crop had very little work put on it after sowing the seed, and, indeed, was not even thinned out. I have been assured by good stock-growers that a bushel of carrots is worth, on an average, as much as oats for cows, horses, or almost any other farm stock. Almost every domestic animal is passionately fond of carrots. And this reminds me, that one day I went to carry a basketful of carrots through the pasture lot. The Jersey cow was determined to have them, and I was equally determined that she should not; and before we got done with each other we had quite a little "circus" there in the middle of the lot. She came out ahead, too, for she got quite a portion of my basketful, even if she did not get all of them. For several years we have had trouble in disposing of our surplus carrots, turnips, and mangels; but this year I thought I would try putting a notice in our county paper, and we have had purchasers for almost all of them, right from the field. Sometimes it *pays* to tell people what you have got a surplus of.

NOTES OF TRAVEL

FROM A. I. ROOT.

The parched ground shall become a pool, and the thirsty land springs of water. ISA. 35: 7.

MIRAGE; IRRIGATION; ANCIENT DWELLINGS IN ARIZONA, ETC.

Arizona, with all its grotesque features, has something more wonderful still in its mirages. Many people, however, have never seen these wonderful visions, if so I may term them, because they have not watched for them and been ready to see what is to be seen; in fact, we did not have a good treat in this line until just as we were leaving the Territory. We took the train at Tempe before daylight, and the sun was rising when we were a few miles away from Maricopa. I was on the lookout, and was rewarded by seeing first a magnificent suspension bridge in the clouds, just over the tops of the mountains. These bridges are perfectly level and straight, and I judge the mountain vapors have something to do with it, for they often seem to settle to a water level; and right along this level, a slender thread, as it were, seems to run from one mountain to another. Now, this might be easily explained were it not that this thread is frequently cut up by regular cross-beams, say like the ties on a railroad, only they are so wonderfully exact and evenly spaced that one would think it was a piece of the finest mechanical work. While you watch, the scene changes, and you are treated to a series of dissolving views. As we came into Maricopa, a wonderful mountain reared its top clear up amid the skies. By and by an arm shot out of the side of the mountain, something like the horn of an anvil. In fact, the whole mountain began to look like a huge blacksmith anvil. While we gazed, the horn began slowly to grow in length, and to stick out further and further into the sky. Pretty soon the point of it narrowed down to a sort of neck, and finally it broke off. Even though it did break off, however, it did not drop, but remained suspended in the air. Then a sort of loop-hole made its appearance in the middle of the anvil near where the horn started out; and this hole kept enlarging until you could see objects on the other side. While this was going on, a tall rock or spire was all at once discovered near the railroad track. It was as straight as some of the great chimneys in manufactories. As it was near the track, near the line we were soon to take, I congratulated myself that we could soon run up to it and see what it was like. I felt sure; there must be some sort of rock to give foundation to the illusion: but when a bystander told me there was no rock there at all, and that those wonderful ranges of mountains we had been admiring were not mountains at all, I could not believe his words. In fact, it seemed as if my senses were a good deal more reliable than his statements. The grotesque mountains, and this wonderful rock, were in plain sight for perhaps a couple of hours, although they changed form a good deal. Imagine my disgust, when we took the train and arrived at the point where the rock ought to be, to find nothing whatever—just the plain level surface of the desert. Sometimes a rock or mountain would be plainly visible while we were standing on one side of the railroad track, but just as plainly *invisible* when we stood on the other side; and this made me think that the iron track, so perfectly straight and true, running away into the distance, had something to do with that wonderful shaft of rock that seemed to shoot almost into the sky. The books tell us that this mirage is a reflection of something that exists somewhere else. Well, now, there is not any such great bridge anywhere in that region; and there is not a mountain that looks like a blacksmith's anvil; and why should these things grow and shape themselves? You may suggest that it was only a queer-shaped cloud or vapor; but this would not explain the cross-ties and other forms of architecture. It was quite evident that nature seemed to delight in sporting in a certain form of regularities. Things would be spaced off into distances so exactly equal that there was no "happening" about it. The reflection of the sands of the desert has something to do with it; and on the great prairies, along the Southern Pacific, through the whole South, I saw now and then long strips of horizon with a streak of either sky or water underneath. The great cornfields in Dakota sometimes produce a similar result. I suspect that these appearances are produced by the same phenomena, to a considerable extent, that show a ring around the sun and moon before a storm—the same thing that produces what we call "sundogs;" and these latter are sometimes accompanied by beautiful geometric circles, as you may have noticed. We have been told, however, that there is really no circle around the sun and moon at all—it is "all in your eye"—at least, so scientists tell us, just as a rainbow is "all in your eye," and that there is no rainbow at all across the heavens, and never was and never will be. Never mind. We enjoyed the mirages of Arizona fully as much as we ever enjoyed looking at a great city or great steamships or great fireworks; in fact, I think I enjoyed them a little more, because the mirage is the work of *nature*, and the other is the work of *man*.

Before leaving Arizona with its wonderful natural scenery I wish to mention a pleasant visit that my brother and I paid to A. J. King, for so many years editor of the *Bee-keepers' Magazine*. That magazine was, as you may know, conducted a great many years, had a large subscription list, and certainly came next to the *American Bee Journal* and GLEANINGS. Friend King is away off in the desert, almost alone by himself. One can not say there is no other dwelling-house in *sight*, for you can see a house thirty or forty miles on the deserts of Arizona, if you have a telescope equal to the need. On page 628, 1891, friend King gave us some enthusiastic reports of this strange country. Well, his anticipations have not all been realized, I believe; and just at the time of our visit an unusual frost had made his fruit-ranch look rather sad and dreary. His wife was away at the time, and he and his boy were living alone amid their fruit-trees and shrubbery. The boy was engaged in clipping off the tops of the small orange-trees where they had been frosted. Right close by his house are some specimens of giant cacti that make one stand and gaze in open-mouthed wonder. I guessed they were 20 or 25 feet high; but friend King said the tallest was over 40 feet; and when I asked about the rapidity of their growth, he said he thought they grew very slowly; for during the three or four years he had been on the place he had not been able to detect any growth at all.

Before I forget it I wish to tell something about the hot season of Arizona. Please remember it is almost as hot there nights as it is in the daytime; and there is so little dew that people sleep outdoors in the dooryard, without any sort of trouble from dampness. In fact, there are times when outdoors is about all the place where one can sleep. During this heated term there are no flies to bother cattle and horses; in fact, I believe they have very few flies or any thing of that sort at *any* season. It may be too hot for the flies, or may be they have not got introduced yet."[*]

I am now going to tell you a wonderful story. A man who was trading in my brother's drugstore brought in some eggs and set them down, and forgot to take them when he went out. They finally set the eggs back on a shelf, thinking the owner would be back for them sooner or later. Time passed, and the eggs were forgotten until somebody heard chickens peeping; and, sure enough, there they were, breaking their way out of the shells, without any help from incubator or mother hen; and yet, with exceedingly high prices for both poultry and eggs, nobody has ever yet utilized this wonderful opportunity for having a self-managing incubator. Just think of it—buy your eggs, spread them out and take care of the chickens when they hatch! Perhaps, however, the weather is not always as favorable as it happened to be at just that particular time. I am daily expecting to hear of some wonderful things from this queer Territory of Arizona. Yes, and there are some magnificent enterprises already under way. One of the firm of D. M. Ferry & Co., of Detroit, Mich., has already purchased some immense tracts of land in the neighborhood of Tempe, and they are constructing enormous irrigating-canals — yes, canals is the word, for some of them would run a canal-boat, without question. These irrigating-canals take the water from Salt River, through tracts of country as yet unused; and already they have demonstrated what may be done, by their success on little patches, in making the wilderness blossom as the rose. It is reported that Ferry is going to raise his seeds—at least a great part of them—in this wonderfully favorable climate. While we were there, an immense machine for excavating was being drawn by, I think, sixteen or eighteen horses. A suitable plow, attached to the great engine, turned a furrow directly on a moving platform. This platform was carried up on rollers until it dumped the dirt down on the side of the canal. The consequence was, the banks were just as round and even as a landscape gardener could make them. They kindly invited us to get up on the machine and go a "bout" with them. When I looked away in the distance, however, and asked them how far one of those "bouts" meant, and was informed that it was *two miles long*, I did not feel able to spare the time. To see work of this kind going on away out in the wilds of an uninhabited desert was to me not only wonderful, but most fascinating. It verifies the words of Holy Writ: "For in the wilderness shall waters break out, and streams in the desert. The parched ground shall become a pool, and the thirsty land springs of water."

All along this river, great enterprises of this kind are starting up; and the only limit, so far as I can see, will be when all the water shall be utilized. Even then, by means of dams, great reservoirs will be filled from the waters that run to waste in the winter time. Still further, where water runs through these desert sands, great quantities of it percolate through the soil and are lost. Cementing the sides and bottoms of these ditches, as they do at Riverside, Cal., will increase the amount of water for irrigating, very considerably.

Oh, yes! I must tell you about the ruins and the broken pottery. Every little while on these desert places we meet with mounds, or sandbanks. Where this sand is scooped away, ancient dwellings are disclosed; and the ground all about these dwellings, and, in fact, all through this mound, is thickly strewn with broken pottery—not only plain pottery, but fragments of painted and decorated ware. These fragments are oftentimes so plentiful that they almost seem to cover the ground. It is like tramping around the pottery-shops here in the East. The decorations seem to run in a particular line of ornamentation, indicating that the people were a great deal alike, or had the same habits and fashions. Implements for grinding their corn are also found. In fact, Arizona is full of curiosities to make glad the heart of the archæologist. One commences, when he first sees these things, to load himself down with specimens. Finally, when he discovers they are everywhere, he loses interest and enthusiasm. It has been thought, I believe, that these relics were left by the mound-builders; but when we discover that the present inhabitants—that is, the Indians—still grind their grain with utensils very similar, and ornament and paint their pottery in a manner quite like these broken fragments, the conclusion forces itself upon our minds that these very Indians may have done this work thousands of years ago. They certainly used Salt River for irrigating, much as we do now, for great irrigating-canals are found almost everywhere. In fact, one company utilized one of these ancient water-courses to an extent that saved them several thousand dollars; and I am told that, even up on the mesas on the mountains there are remains of irrigating-ditches showing that the Indians must have had a system of canals that carry the water to points that would seriously trouble our best modern hydraulic engineers. How did the sand get over these ancient dwellings? Well, it has been suggested that it is the work of the wind. Any sort of obstruction in the desert, even a bush, catches the sand, and it piles up around it; and as ages pass, it is not strange that considerable hills are piled up in just the way that snow frequently piles up into immense snowbanks, where it lies on the ground and accumulates for a long time.

Orange-growing in Arizona is, in my opinion, as yet hardly settled. Last season a carload or two of the finest oranges that perhaps ever grew anywhere were put on the market, and they claim they can produce them several weeks earlier than in California. Since then, however, a severe frost has made considerable havoc with the same trees that bore this nice fruit. Perhaps some of our Arizona readers in the vicinity of Phœnix and Tempe will tell me how the trees "panned out" since the time of which I speak.

---

[*] Since the above was written, our stenographer, W. P. Root, suggests: "The larvæ of flies and similar insects can not develop in a climate so destitute of moisture as is that of Arizona. The complete desiccation of meat that occurs when exposed in such arid climates as that of Arizona and parts of Palestine is well illustrated in the case of Samson, who found the carcass of a lion which he had lately slain, and it was so dry that the bees had filled it with comb. This shows that the flesh was odorless and hard, and hence not moist enough to furnish larvæ the means of subsistence, which, as in the case of all forms of life in their first stages, consists almost entirely of liquid food. It might be suggested, then, that the bees made a mistake in building in such a place if their larvæ could not develop; but it must be remembered that the bees can and do supply the necessary moisture to *their* larvæ, while *flies* pay no attention to theirs after the egg is laid."

TOBACCO COLUMN.

CONDITIONS UNDER WHICH WE GIVE SMOKERS TO PERSONS WHO STOP USING TOBACCO.

First, the candidate must be one of those who have given up tobacco in consequence of what he has seen and read in this department. Second, he promises to pay for the smoker should he ever resume the use of tobacco in any form, after receiving the smoker. Third, he must be a subscriber to GLEANINGS. Any subscriber may, however, have smokers sent to neighbors or personal acquaintances whom he has labored with on the matter of tobacco-using, providing he give us his pledge that, if the one who receives the smoker ever uses tobacco again, he (the subscriber) will pay for the smoker. The one who receives the smoker in this case need not be a subscriber to GLEANINGS, though we greatly prefer that he be one, because we think he would be strengthened by reading the testimonials from time to time in regard to this matter. The full name and address of every one who makes the promise must be furnished for publication.

Send a smoker to Samuel Roach. If he uses tobacco again he will pay for the smoker. His address is Amity, Pa. H. W. VANKIRK.
Washington, Pa.

Having been a subscriber to GLEANINGS, and being induced to give up the use of tobacco thereby, I now claim a smoker. If I ever use the weed again I will pay for the smoker.
A. H. COOPER.
Tanners, Gilmer Co., W. Va., June 27.

My son, C. H. Otis, who has smoked and chewed for ten years, has agreed to quit for good if you will send him a smoker. I will pay for it if he ever commences again. I. OTIS.
Dunlap, Har. Co., Ia., June 7.

My boy Pearl has been using tobacco for the last two years, but has agreed to quit off if you will send him a smoker. If he begins again I will pay for it. R. G. MASON.
Duncan's Falls, O., July 13.

Please send a smoker to Thomas Gore, Cassville, Ga., for a tobacco pledge. If I ever know him to use tobacco again I will pay you for the smoker. R. W. J. STEWART.
Bowls, Gordon Co., Ga., July 24.

You will please send me a smoker, as I can conscientiously say that it was from reading your journal that I was influenced to make the resolve to give up the use of tobacco. I promise that, should I ever use the weed again, I will pay you for the smoker. J. W. BOASE.
Rising Star, Texas, June 21.

I quit tobacco last May, and I think I am entitled to a smoker if any one ever was, because it is through you that I quit. May you live to give smokers to thousands more is my wish. If I ever use the weed again I will pay for two smokers. R. F. HETRICK.
Ceresco, Neb., Sept. 12.

Walter and Joe Green, sons of my neighbor, say they will quit tobacco for a smoker each. If they get them they understand the conditions. I have been watching for something to grow out of this tobacco business in these parts, and here are the first-fruits. It seems to me that this expensive and filthy tobacco habit will some time in the future be considered unfit for our good Christian people. W. H. EMBRY.
Water Valley, Miss., July 26.

I have a man working for me, and he has taken to bees like a duck to water; and as he has been reading your journal considerably, and I too have explained the Tobacco Column to him, I have got him in the notion of giving up the habit of using tobacco; and I am sure he would appreciate a smoker if you would send him one, and I promise to pay for it if he ever uses tobacco any more—that is, so long as he is under my jurisdiction. He has four fine colonies of bees, and he takes great pride in them. His name is John S. Peters. T. V. JESSUP.
Greeley, Col., July 8, 1892.

Find inclosed an order. Two of the smokers are for parties who have given up the use of tobacco. I will vouch for them, and will watch them closely; and if they ever use it again I will pay for the smokers. The names of the parties are Alex. P. Callen and Barek E. Turner, both of this place. M. M. CALLEN.
Moravia, Ia., June 25, 1892.

I have a grandson who assists me in the bee-business. He had become an inveterate tobacco-worm, and I insisted on his quitting off entirely. The other day he said he had quit tobacco—had not used any for a month, and he had determined to stay quit. He says he wants me to write to you to send him a smoker upon your usual terms. If you send it I will vouch for him, and pay for it if he breaks his promise. His name is M. H. Sims. F. M. ALLEN.
Renfroe, Ala., July 9, 1892.

A neighbor of mine, Milo Hiler, called at my place the other day to see if I had a second-hand smoker to sell. Knowing he was in the habit of using tobacco I put your proposition to him. In reply he said that, three days before, he had given his heart to God, in a revival meeting, and that the next morning in his own home he prayed to God to remove his tobacco appetite, which he has done. As he had taken the pledge before I spoke to him, I told him I did not know whether he was entitled to one, but that I would write and tell you the circumstances; and should he be entitled to one under your offer he will pay for the same should he resume the habit. E. S. DART.
Sparta, Mich., July 26, 1892.

[To be sure, he is entitled to a smoker, friend D. Judging from my own experience, I think it quite likely the temptation to use tobacco will come back again—not that the grace of God will ever diminish, but that friend Hiler may, as time passes, now and then forget his sacred pledge. The smoker may possibly prove to be an object-lesson and a reminder.]

I see your Tobacco Column is getting to have many names in it. I had a party here the other day to whom I sold five Dovetailed hives. They were burned up at the station. I had quit using tobacco myself, and I told him that tobacco was hurting him. He had sour stomach about all the time, and a doctor giving him medicine that did him no good. I told him to let the tobacco alone, and then he would be all right; so when he came the other day for more hives he said he was much better, and not troubled much with sour stomach. I told him your terms about a smoker, and he said he would pay for it if he ever used tobacco again: and if he doesn't do so I will. His name is Samuel Roach. H. W. VANKIRK.
Washington, Pa., April 9.

As I am an invalid, and have been for years, I am obliged to employ help in my apiary. I have had a boy to help me for two or three years past. He is 16 years old now. He has been using tobacco for some time past. I told him of the Tobacco Column, and told him if he would quit the use of the filthy weed you would send him a smoker. He then wished to see the Tobacco Column. After reading the conditions under which he could get the smoker he promises me that he will agree to all the conditions therein stated. Should he commence it again I will pay for the smoker. His name is Wesley Rhinehart. F. S. THORINGTON.

Chillicothe, Mo., July 29, 1892.

Friend Root: I herewith inclose a clipping from the Fort Smith *Daily Times* of July 3. I thought you would perhaps like it for your Tobacco Column:

CHARLEY WALLACE DEAD.

Yesterday morning Charley Wallace, son of Mike Wallace, breathed his last at his father's residence on Twelfth St. His illness was long and painful, and was caused by the excessive use of cigarettes. He was a bright boy, and gave promise of making a fine man, as he had many fine traits of character; but he became addicted to the use of the deadly cigarette. His father and mother were constantly in attendance at his bedside during his long illness, and all that medical skill could do was done to alleviate his sufferings.

Mike Wallace, the boy's father, is one of our most prosperous business men, and his many friends sympathize with him and his wife in their bereavement. We have a law in this State which prohibits the sale of cigarettes to any one under 16 years of age; but we have some men among us who care very little for the law so long as there is a dime in sight. The man who had been selling Charley the cigarettes was arrested, and fined $10 for his offense, which I deem a light penalty for what is but little better than murder. Z. WELLS.

Fort Smith, Ark., July 4.

GLEANINGS BEE CULTURE

A Journal devoted to Bees and Honey and Home Interests.

Illustrated Semi-Monthly

36 Pages 7×10

$1.00 Per Year

For our light affliction, which is but for a moment, worketh for us a far more exceeding weight of glory. II. COR. 4:17.

THIS is a great year for honey *due* but not received.

SOME one is doing some very excellent editoial work in the *Canadian Bee Journal*. Some of it, at least, sounds like Jones the bee-man.

THE editor of the *Nebraska Bee-keeper* says he has attended one State and three county fairs this fall, and at none of them has he heard a good word spoken for the Punic bees.

THE old exploded sting-trowel theory — bees capping over honey with their stings as trowels, and injecting bee-sting poison into the cells — is now going, or, rather, trying to go, the rounds of the press again.

AS will be seen in another column, the British bee-keepers have definitely arranged for an exhibit of British honey at the World's Fair. We may rest assured that our English cousins will make a fine exhibit. In their own country they excel us in honey and bee-shows.

WE are getting reports now, that a solution of salt water fed to the bees in syrup, or sprayed direct on the combs, does not cure bad cases of bee-paralysis (nameless bee-disease). As the disease sometimes goes off itself, it may be questioned whether it does any good, even in *mild* cases. How is it, friends?

WE have just received from the W. T. Falconer Co. samples of their new Falcon sections. In our judgment they are the nicest of any thing heretofore put upon the market by any maker. Our new section-machinery will be done in a few weeks, at which time we hope to make a product fully their equal. To make any thing better would be impossible.

WE regret to announce that the health of Mr. J. Huckle, business manager of the *British Bee Journal*, has been such that he has been obliged to give up his work. Our business relations with Mr. Huckle have been very pleasant, and we hope that a rest will restore him to health. The business hitherto done at King's Langley will be transferred to 17 King William St., Strand, W. C., London, where all communications for the *B. B. J.* should be addressed.

THE October *Review* contains a couple of excellent half-tones showing the exhibits of Hunt and Hutchinson, reference to which was made in our editorial on page 710, for Sept. 15. Both these exhibits were unique in their way, and we had intended to "do 'em up" in half tones, but the daylight photos were too poor to be worked up satisfactorily. Bro. Hutchinson succeeded in giving some good pictures from flash-light photos which we judge were taken later.

WE regret to announce that the office of the *Progressive Bee-keeper*, of Unionville, Mo., was destroyed by fire last month. Bro. Quigley lost the back numbers of his journal, including books, papers, and other stock. Although there was no insurance, and the loss a severe one, the *Progressive Bee-keeper* will be issued just the same, the subscription-book having been saved. By the way, there are too many bee-keepers and supply-dealers who go without insurance. At the low rates usually secured, no one should think of going without protection.

QUITE a number of our friends (well meaning, of course) take the liberty, without orders or first writing, of sending us queens that they have after uniting. Along with the queens comes a card asking us to credit on account what we can. It seems like a hard thing to do, but we are obliged to send the queens right back by the next mail, as we have no use for them. We, like all the rest in the North, are uniting, and, of course, have a surplus of queens on hand of our own raising. Our stocks, as we advertise, are bred from selected mothers, either in our own yards or in the yards of our regular queen-breeders in the South. It would not be fair nor right for us to accept queens from everybody, and send them out to our customers. The *stock* might be just as good, but we have no assurance or guarantee of it.

HARD ON PUNICS.

WE extract the following from the *Canadian Bee Journal* for October 15:

> The Punics are the biggest fraud ever put on the bee-keeping world. I got one twelve months ago to see if it would improve the yield of an out-apiary I am operating. She turned out fertile, and the fifty colonies in that yard are mostly pure Punics (those that are left, I mean), having killed and replaced a number. The Punics sting worse, and the sting is more painful. The queen is more difficult to find, and they prefer to fill the brood-chamber with honey rather than store above. I advertised them in the spring, and, judging from the letters I had, I could have sold hundreds, if I had not given my customers my opinion of them.
>
> Avery, La. H. FITZ HART.

Some of our friends will remember that we were severely scored because we told some hard things about the Punics. The above from the *Canadian Bee Journal* looks as if we told some straight facts, and thus saved some of the friends from investing early in the season in some very undesirable bees.

THE COUNTRY GENTLEMAN.

I HAVE many times of late felt like expressing my gratitude and appreciation to the agricultural journals of our land. I do not feel like saying that any one of them is the best agricultural paper published, for it would be a good deal like comparing my friends and relatives. Some excel in one thing and some in another. I have often felt like saying, however, that there is something about the *Country Gentleman* that renders it specially valuable to me. I have often wondered who it is that keeps such a steady, keen eye on every thing that goes into its columns; and I have finally concluded that it must be some old veteran in agriculture—somebody who knows what has been done, and what is likely to succeed and likely to fail—some one who is fully *competent* to put on the brakes when a lot of us are inclined to start off in error. Another thing, there is a sort of dignified gentility about this periodical that makes one think it is rightly named. It *costs* a little more than some other papers; and, by the way, it *usually* costs something to move in the best society, and to have for your companions learned and intelligent men. Sometimes I have thought that this veteran who answers so well and so wisely almost any question that may be asked pertaining to agriculture, was a little conservative; but it is a pretty good fault, after all; and I am real glad that, among all our various periodicals of this sort, we have at least *one Country Gentleman*.

MATING CHOICE QUEENS TO CHOICE DRONES ON HANLON'S ISLAND.

A SHORT time ago a firm in Canada advertised that their queens were mated to hand-picked drones on Hanlon's Island. A resident of Toronto (he has moved away now) wrote us shortly after, that there were no bees on Hanlon's Island, and that the mating of queens there was all a myth. We promptly wrote to the parties in question, for an explanation. They assured us that it was a fact, and referred us to the names of several parties as proof — among them Mr. John McArthur, 881 Yonge St., Toronto, who bred the queens for them.

It seems Mr. M. has had in mind the mating of choice queens to choice drones on this island for ten years or so back; but until 1889 it was so barren that bees could not be supported there except at an expense. At that time the city of Toronto spent over a hundred thousand dollars in beautifying and improving the island; and it is now stated that it blossoms like the rose, and will support a large apiary. Mr. McArthur took advantage of the situation and put upon the island some choice stocks, and has been experimenting for three years back with the matter of mating queens to drones of his own choosing.

The island itself is two miles from the city, by a bee-line, while the bees that have been used for experimental purposes were a mile and a half further, on the other side of the island—quite a safe distance for mating. Mr. M. proposes to raise queens there the coming season; and as it is a great pleasure-resort, ferry-boats go back and forth every thirty minutes, and hence orders for queens can receive prompt attention. This may seem like a little free advertising; but when a bee-keeper has enterprise enough to take advantage of a good thing we feel like encouraging him; for it would indeed be very desirable, and a great boon to bee-keepers at large, if we could take drones, say from Mr. Doolittle, and choice queens from Mr. Manum's honey strain, and have them crossed. In speaking of this we do not forget D. A. Jones' experiments in the same direction on some islands in Georgian Bay. The islands being barren of nectar-bearing blossoms, the enterprise was abandoned on account of the expense.

The great trouble all along in queen-rearing has been the inability on the part of bee-keepers to perfectly isolate and so perpetuate certain desirable characteristics in certain bees; and it is only those who have easy access to an island who can do so with reasonable certainty of success. Say, Dr. Mason, what is the matter with your appropriating a small island off from Toledo, and running a rival establishment to the Canadian enterprise? You know you like to "give it to the Canucks."

CASTLES IN THE AIR; BLUNDERS OF A BEGINNER; OUT-APIARY IDEA CARRIED TO EXTREMES, ETC.

A CASE has recently come to our knowledge where a beginner bought an out-yard, with little or no previous experience with bees, containing 100 colonies. As to whether they are paid for yet we can not say. With these he had high anticipations, and proposed to secure, the first year, fifteen thousand pounds of honey. The bees were hybrids; and in order to improve his stock and get more honey he ventured to Italianize them at once—a doubtful venture, so far as the honey was concerned, and, so far as the bees were concerned, when they could least afford it. Without counting the cost of advertising space, he ordered several insertions of a two-inch advertisement. Now, hybrid queens do not usually sell for more than 30 or 40 cents. He continued to advertise until he had paid out as many dollars as he could possibly get for his queens. His next step, so we are informed, was to divide his 100 colonies into yards of 20 stocks each, these yards being anywhere from four to eight miles apart. His locality was sufficient to have supported almost 100 alone, to say nothing of going to the expense of dividing them up into four or five apiaries, and traveling miles to get to them, besides carting stuff back and forth. Did he secure his fifteen thousand pounds of honey? Not quite. As nearly as we can ascertain, he obtained less than one thousand pounds. The probabilities are, that his honey cost him a great deal more than he will get for it in the markets; and as to the hybrid queens sold, his net profit was nothing—yes, worse than nothing—and winter is staring him in the face.

You may say a man is a fool to go into bee-keeping in such a mad sort of way. We fear there are some who do something nearly as bad. They are crazed over the out-apiary idea, big crops of honey, big prices, and go to moving their bees away from home when they had better keep them all in one yard, even though they do not do quite as well. One year's experience is usually sufficient to drive them out of the business entirely. No one should think of establishing out-apiaries until his home apiary has got at least beyond 75 colonies; and even with 200 he had better not have more than two or at least three out-yards; but a great deal depends upon the locality. Some places—in Cuba, for instance—will support 500, and others less than 50.

Let us rehearse briefly the mistakes, some of which many make: In the first place, in the case mentioned, our beginner bought too heavily; second, he requeened his apiary when they could the least afford it; third, he failed to consider that the price of his product was too low to warrant much expense in advertising; fourth, he ought to have kept his bees in his home yard instead of scattering them into out-yards. Lastly, his great castle in the air obscured sober, intelligent judgment.

WHAT A PUDDING

That quaint old expression of our forefathers is so apt. We think of it daily when we look back ten years and recall how Victor Bicycles have outstripped all rivals.

What a pudding we have in the Victor Cushion and Pneumatic Tires, Victor Spring Fork, and the like.

No wonder Victors lead!

SPECIAL NOTICES.

Remember only a month remains before the early-order discount drops from 5 to 4 per cent. Get your orders in early and secure the largest per cent off.

Until further notice we will pay 5 cts. each for GLEANINGS for May 1, 1890. Also for the Dec. 1 No., 1886. Remember, don't make a mistake in the number or year.

DAMAGED QUINBY'S NEW BEE-KEEPING.

The 50-ct. class of these books mentioned in last number were all gone in a few days, and several orders had to be filled with the 85-ct. class. We still have a few of these left at 85 cts., postpaid, or 75 cts. with other goods. Have sold some of the Abbott lithograph labels, slightly damaged, at $1.00 per 1000, and still have a good supply of these, as well as the perfect ones at $1.50.

HONEY MARKET—COMB AND EXTRACTED.

As we go to press, our car of comb honey has just reached us from Nevada. There are 1142 24-lb. cases in the car. From our notice of the honey two weeks ago we already have considerable of it engaged. The prices we made are low and compare favorably with the general market reports. They are:

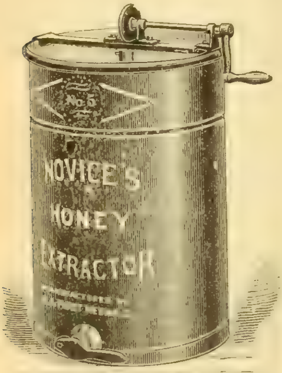
In lots of 1, 2, or 3 cases, 18c per lb.
In lots of 4 to 8 cases, 17½c per lb.
In full crates of 9 cases each, 17c per lb.
5 full crates, or 45 cases, 16½c per lb.

Since we have been receiving and shipping comb honey put up to ship by freight, several cases packed in a crate, with handles, we have not lost a pound by breakage, and we don't remember to have had any damage reported from customers to whom we have shipped, while we used to be bothered a good deal by breakage. We mention this that none may be deterred from ordering because of fear of breakage in shipping. Single cases by express are very often broken; but crates of several cases by freight, rarely if ever.

We have had very little response to our request in last issue for offers of extracted honey, and what we have received show that there is a scarcity of choice extracted honey, and it is commanding a good price. Many of the samples submitted are rather inferior in quality. We have secured some of as fine honey as we ever saw. It comes from the northeast corner of New York State. We are obliged to ask for it 10 cts. a lb., in 60-lb. cans, two cans in a case. It is so nice that, with the present condition of the market, it is well worth the price. It is light-colored, very heavy in body, of a fine flavor, and almost pure clover. If ordered at once, we can supply a limited quantity of it f. o. b. at Massena Springs, N. Y., at 9½ cts. per lb.

IMPROVEMENTS IN EXTRACTORS.

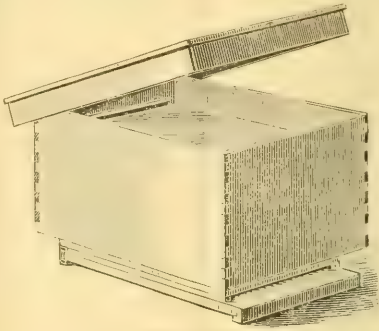
While we have made great improvements in hives, the old original Novice honey-extractor, as well as the Cowan, has received its share of attention. No changes or improvements have been made except those that have been suggested by practical extracted-honey men and practical mechanics. There seems to be a general preference for a bevel gear, with crank at the side of the can. Besides that, it seems to be necessary, on account of breakages, to make the arm reach clear across the can. All our extractors for 1893 will be made with the new gear. Parts of the old gearing will be kept in stock, to make repairs for extractors already in use. Besides the gearing, we have made substantial improvements in the way of honey-gates, and in the bottom of the can itself, all of which will be thoroughly appreciated by the practical bee-keeper. Although great improvements have been made, the prices will remain the same. See our catalogue.



NEW NOVICE EXTRACTOR.

OUR NEW OUTSIDE WINTER-CASE.

The reports of this year and our own experiments last winter justified us in the belief that a sealed cover for outdoor wintering, with packing material above and around the brood-nest, was the correct method. In accordance with this idea we modified our winter-case for Dovetailed hive by giving it a telescope cover (see cut). This permits of using the old cover on the hive without disturbing the sealing and at the same time affords better access for pouring your packing material around and on top of the hive. The bottom inside edge of the case is stopped up with padded sticks as before, so that the space between the hive and the case is closed up. We do not think it necessary to go to the extra expense of an extra bottom for the winter-case. It is not the bottom that is to be kept warm, but the top, and that should be sealed and protected. Our extensive experiments last season prove this.

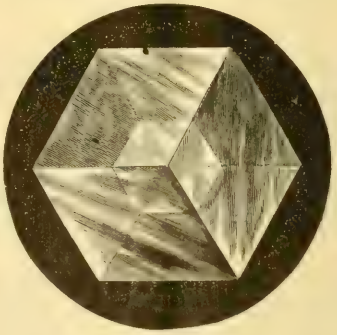


OUR NEW WINTER-CASE.

PRICES FOR 8-FRAME DOVETAILED HIVE.

New dovetailed winter case, including cover and padded sticks, 50c each; 10 for $4 50; or 100 for $40.00. Winter case, nailed and painted, 75c each; 10 for $6.50. For those who want winter-cases for their Simplicity 10-frame Dovetailed hives, the price will be 10c each more than above prices.

DODECAHEDRON PAPER-WEIGHTS.



Two years ago we made a special importation from Germany of 1000 of the beautiful glass paper-weights of which the above is a very poor representation. Nothing would be more appropriate for a bee-keeper, as it illustrates the mathematics of the honey-cell to perfection. It is such a beauty that anybody will be pleased and delighted with it. No matter which way you turn it, you will be charmed by new beauties. The above cut gives the actual size. When we found it in Chicago it was retailing at 50 cents; but buying 1000 of them we got them at a figure that enables us to sell them at 20 cents each, or 6 for $1.00; one dozen for $1.80. By mail, 3 cts. extra on one; 12 cts. extra on 6, or 20 cts. extra per dozen for postage, and packing to prevent injury. We will send one free postpaid for a new subscription to GLEANINGS with $1.00; or for a new subscription, with your own renewal, with $2.00, and 5 cts. for postage, we will send two; or, if you prefer, we will send one and a copy of any of the following books, you paying postage (5 cts.): Merrybanks and His Neighbor; Stepping Heavenward; Christian's Secret of a Happy Life, paper; Robinson Crusoe, paper; or any of the following, and we will pay postage: Revised New Testament; Ten-cent Dictionary; Child's One syllable Primer.

KIND WORDS FROM OUR CUSTOMERS.

"HIGH-PRESSURE" GARDENING, AND NO MISTAKE.

The following is put in this department because it came too late to go anywhere else:

Friend Root: I notice in last GLEANINGS that you speak of the new celery culture. Well, we have tried it, not on a large scale, but sufficiently so to warrant us (that is, me and family) in making a special effort the coming season in that direction, that our finances may be increased somewhat. We think we can get ten or twelve dollars per rod out of it very easily, with just a single crop, while two crops *can* be grown. Yes, it requires plenty of manure and water. The manure can be put on, but how to water these beds is the question. We think we can water on a small scale quite satisfactorily; but on a large area it is what will "get" gardeners. No doubt some way will be devised as we progress in *new* culture of garden products. Some plan shows itself when it is needed.

THE NEW ONION CULTURE.

This suits us pretty well after trying it two seasons. I will enlarge a little on it as we learn. We have grown onions weighing a pound and even a pound and a quarter, and have done it quite easily too. We are just finding out that it is not the great amount of land plowed or seed sown that gives good returns. It is that which is well taken care of that fills the market-wagon and brings in the cash. Can any one tell why it takes a man a lifetime to learn a few simple things? C. H. WELCH.

Krumroy, Summit Co., O., Oct. 24.

SELLING GARDEN PRODUCTS FOR GOOD PRICES.

Mr. A. I. Root: Some of the readers seem to have become excited about the exorbitant prices that you have charged for onions; and as it involves principles of morals and finance it seems to us worth discussing. But we don't think the true solution of the matter has been reached. A person who possesses advantages not attainable by others is in the position of a monopolist, and should not push his advantages to such an extent as to be oppressive to those who have been less fortunate. F. H. Finch seems to have been in such a position on that Dakota farm, and he acted in a very honorable manner; but "circumstances alter cases." If I understand it, A. I. Root had no such monopoly of location or soil, but merely did what any other person could have done. But they all chose to do something else, or to do nothing, even at the risk of not getting any onions at any price. In that case they can not complain at being charged all the onions were worth. If everybody had neglected to plant onions they could not have been obtained at *any* price. The advantages, therefore, that A. I. Root obtained were the result of industry; and to refuse to take the highest price they would bring would be to deprive labor of its just reward. It is all well enough for a person who chooses, to raise things and partly *give* them away; but it is a detriment to those who may wish to engage in the same business for a living. Besides this, *giving* labor to others may encourage idleness. If anybody *wants* to give away any thing, let him give to the *poor* and the *unfortunate* who can not help themselves, and not to those who *can*. HORACE COCHRAN.

McLean, O., Oct. 12.

A KIND WORD INDEED.

Brother Root:—Although we are strangers in flesh, yet I feel that we are united spiritually. I got acquainted with you through GLEANINGS. My father took it when I was a girl, and has continued to take it for years. I enjoyed reading Our Homes, and received much information and benefit from them. One piece that particularly taught me an important lesson was one that had a sentence in which I read something like this: "Girls should not say or do any thing that they would not like their mother to know, or boys their father." That sentence so impressed my mind I was led to practice it, and, I can say, with grand success too. In keeping company I never forgot this; and while this was such a good rule for me, I think it worth commending to others. I would that all young folks would try this rule—make a confidant of their mother; tell all of their affairs to her, and ask her advice as I did. Well, I am married now, and have two nice children. I made a visit to my parents this spring; and while at home I again had the pleasure of enjoying a very refreshing piece from GLEANINGS. The text was, "If any of you lack wisdom, let him ask of God, who giveth to all men liberally, and upbraideth not; and it shall be given him." This piece was liked by several. Pa said that he had read it several times. I brought the book home with me; and Sunday evening, when we were enjoying the presence of a few friends and relatives, that piece was read and very much appreciated. So, Bro. Root, I extend many thanks to you for those articles and others. I would say, go on in the work that God has called you to do. It can't be told just all the good that you have done. "Cast thy bread upon the waters, for thou shalt find it after many days." The Lord reward you according as you have been faithful, and abundantly bless you.

Carrollton, Ill., June 30. MATTIE B. MEEK.

THE DOVE-TALED HIVE.

A HOOSIER POEM.

You may talk about the progress made
in movable-frame hives;
Of menny things accomplished we have
worked at all our lives;
Frum the log-gum in the orcherd
to the chaff hive on the lawn,
Of the patent fancy fixtures that wuz
failures, dead and gone;
Of the freaks and foolish noshens
never hearn tell of afore,
And the menny new departures
in the apperculture lore;
But thare's *one* thing, I'm a-thinkin',
that's ferever bound to be—
That's the dove-taled hive, my reeders,
and hit's good anuff fer me!

Sum prefurs to use the Langstruth,
sum the Adare and Queenbee;
Sum hit is that hev the Headon;
others, Rute's Simplexity;
And thare's others that's a-gittin'
little "crosswize" frum the rest,
In a different "frame" set up a klaim
fer holdin' of the best;
Menny fellers take the Long Ideer,
and run hit all alone;
Sum ain't sattersfied with enny—
'cept a patent of their own!
And I've hearn tell of *sum* fossils
holed up in a holler tree—
But the dove-taled hive, my reeders!
Hit is good anuff fer me!

Oh the dove-taled hive's so handy,
hit's so cheep and easy made
That hit lays the hull gee-possy
of the others in the shade!
And I know thare ain't no pictur
that's so pleasin' to the eye,
Than to see hit chucked clean full of
honey, filled up three stories high;
And the yaller, hummin' 'Talyens,
with their bodies podded out,
With the necktar frum the clover,
jest a-buzzin' all about—
Geemses rivers, but the likens
is a purty sight to see!
Fer the dove-taled hive, my reeders,
hit is good anuff fer me!

Alexandria, Ind. EVAN ELLERY EDWARDS.

5 Per Cent Discount On All Goods

Listed from pages 10 to 30 of our price list, which are ordered between now and Dec. 1st, for next season's use. This does not apply to goods on other pages, except those mentioned. **A special reduction of 20 cents on each two-story chaff hive,** ordered for a limited time. The quantity and early-order discounts to apply also. Special prices quoted on sections in lots of 2000 and upward. Name the quantity and size when you write. We guarantee as good a quality for the price as you can obtain anywhere. Dealers should not fail to write us before making contracts for another season's supply. We offer special inducements.

HONEY COLUMN.

CITY MARKETS.

BUFFALO. *Honey.* The honey market is virtually unchanged; reasonably active at 15@16 for fancy 1-lb. comb. In a few instances a little more is obtainable. No. 2, 12@14; 1½ and 2 lb., 13@14. Dark buckwheat, etc., from 12c downward, as to actual condition. We are still in need of a good many tons for our winter trade, and feel entirely safe in assuring consignors that it is impossible to do more with it than can be done in this market. We will advance all that it is worth, or those who do not wish to consign will do us a favor to write us.

BATTERSON & CO.,
Nov. 9. 167, 169 Scott St., Buffalo, N. Y.

CHICAGO. *Honey.*—Fancy white comb honey is scarce, brings 18c and demand good. dark grades of comb are very slow of sale. Extracted steady at 6@9c, according to quality, color, and flavor.

R. A. BURNETT,
Nov. 9. 161 So. Water St., Chicago, Ill

BOSTON.—*Honey.*—We quote our honey market a little slow, a car of California comb honey having arrived and selling at 16@17c, and the Vermont selling slowly from 17@18. Extracted, 8@9. *Beeswax*, 27.

BLAKE & RIPLEY,
Nov. 10. Boston, Mass.

CLEVELAND. — *Honey.* One-pound sections, A1 white honey, 17@18c; second grade, 15@16; dark, 13@14. *Beeswax*, 18@23, according to quality. Beeswax is rather dull sale at present.

REYNOLDS & WILLIAMS,
Nov. 9. 80 & 82 Broadway, Cleveland, O.

DETROIT. *Honey.*—Comb honey in fair demand at 13@14c, and for best white 15 could be had. Extracted, white, 8@8½. *Beeswax*, 25.

Nov. 10. M. H. HUNT, Bell Branch, Mich.

CINCINNATI.—*Honey.*—There is a good demand for honey, with a scant supply of all kinds. Extracted brings 6@8c on arrival; comb honey sells at 14@16c in the jobbing way, Although honey is scarce, there is no demand for dark comb. *Beeswax* is in good demand at 22@25c on arrival for good to choice yellow. Supply is good. CHAS. F. MUTH & SON,

Nov. 9. Cincinnati, O.

KANSAS CITY.—*Honey.*—We quote: Comb, No. 1 white, 1-lb. comb, 17@18; same, No. 2, 15@16; No. 1 amber, 1-lb., 16@17; same, No. 2, 10@12. Extracted, white, 7@7½; amber, 5@6. The receipts of comb honey are light, demand good. *Beeswax*, 20@25.

Nov. 10. CLEMONS-MASON COM. CO.,
Kansas City, Mo.

ST. LOUIS.—*Honey.*—There is no material change in the market except strained, which shows an active demand. We quote: dark comb, 8@10; medium, 10@12; white, 16@17. Extracted dark, in barrels, 5¼@5½; medium light, 5¾@6; light, 6½. *Beeswax*, prime, 24. D. G. TUTT GROCER CO.,

Nov. 10. St. Louis, Mo.

KANSAS CITY.—*Honey.*—There is a good demand for honey, but a very light supply. Price of 1 lb. comb, white, 17c. Extracted, 6@7½. *Beeswax*, 22@25.

HAMBLIN & BEARSS,
Nov. 10. 514 Walnut St., Kansas City, Mo.

NEW YORK. *Honey.* The market is good. Buckwheat honey in 1-lb. sections brings 10½@11½; buckwheat honey in 2-lb. sections, no demand. Clover honey in 1 lb. sections, glassed, and pasteboard boxes, in good demand for fancy at 17c. Clover, in 2-lb. sections, 14@15. Extracted, clover, 8@10.

CHAS. ISRAEL & BROS.,
Nov. 12. 110 Hudson St., New York.

FOR SALE.—5000 lbs. choice white-clover and basswood honey; all in 1-lb. sections, packed in 12-lb. single-tier crates, delivered at R. R., 16c per lb.

21d FRED H. FARGO, Batavia, N. Y.

FOR SALE.—10 barrels choice white-clover honey. Will put it up in almost any style of package desired. Price on application. 20tfdb

EMIL J. BAXTER, Nauvoo, Hancock Co., Ill.

WANTED.—Farmers in the cotton States to know that lintless cotton is now the biggest discovery in America. Lintless cotton yields nothing but lintless cotton seed, and is a very valuable plant in this age of cotton-seed-oil mills. Price from Nov. 1, $1.00 per pkg., one quart in each pkg.

R. H. CAMPBELL, Madison, Morgan Co., Ga.

Eastern Supply House.

We furnish every thing used in the apiary, and at bottom prices. Illustrated circular free.

I. J. STRINGHAM, 92 Barclay St., N. Y.

21 20db Please mention this paper.

FOR SALE. A No. 2 Corley Saw Mill; 3 head-blocks with patent board dogs; 52-inch Disston circular saw; 64 feet track. Capacity of mill 8000 to 12,000 feet in ten hours. Mill is nearly new, Warranted to be in first-class running order.

M. H. FAIRBANKS,
HOMER, CORTLAND CO., N. Y.

WANTED.—To exchange a heavy power saw-mandrel for small foundation mill. Also saw-table for light power, for Barnes saw. W. C. SIMONS,

21d Arlington. Wayne Co., Pa.

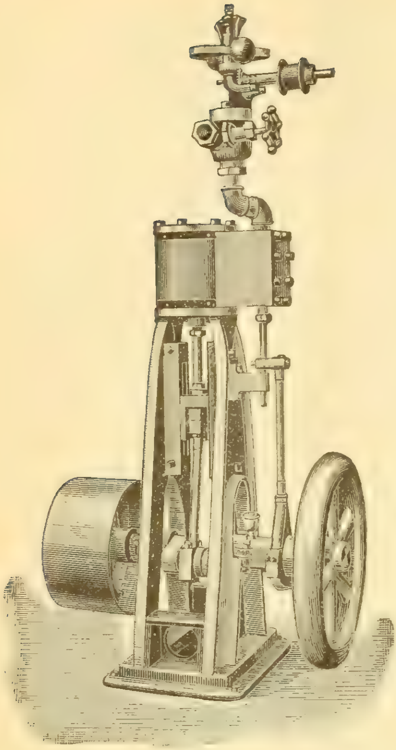
WANTED.—To exchange English Beagle hound pups, best dogs on earth for hares or rabbits, for Winchester shot-gun or double gun of modern style, or offers. D. S. HALL, So. Cabot, Vt. 21tfdb

WANTED.—A young man to look after a small apiary and make himself generally useful in a store and orange-grove.

H. PRICE WILLIAMS, Richmond, Fla.

WANTED.—Second-hand printing-press, 7¼x13¼, or near this size. Give description, price, etc.

J. F. MICHAEL, German, Darke Co., Ohio.



ENGINES.

Yes, we build a few. We have, in connection with our large bee-plant, a first-class, well-equipped machine-shop, in which we build all kinds of bee-hive machinery, saw-mandrels, saw-tables, dovetailing-machines, foundation-mills, extractor-gearings, etc., and, when our men have nothing else to do, engines. These are upright in style, and economize floor space. They are built under the special supervision of an expert machinist of many years' experience. The rods are all of finished steel. The cross heads and slides are of the substantial locomotive style. The cylinders are lagged with Russia iron, and are brass-bound. The boxes are babbitted, and can be easily taken up for wear. The piston-head is provided with two expansion-rings. The bright parts shine like a dollar. The governor is a Waters, substantial and reliable. We have three of these engines running in our works. One has been running two years, with excellent results. Making them, as we do, during our dull season, they are immeasurably superior to the ordinary engines of their kind, and the price is low, considering the very fine quality of the work. Price of the 2½-horse-power engine, governor and govener-belt, all ready to attach to a boiler, $75; 5 h. p., $100; 7½ h. p., $125; 10 h. p., $150. These prices are net, although we will make the usual discount for cash. If you want a thoroughly well-made engine, you can not do better than to select one of these, providing the range of power is within what you need. While we compete in quality of workmanship we can not compete in price with some of the cheap engines on the market.

A. I. ROOT, MEDINA, OHIO.

TILE ✠ DRAINAGE.

BY W. I. CHAMBERLAIN, A. M., LL. D.,

Formerly Secretary of the Ohio State Board of Agriculture, and late President of the Iowa State Agricultural College. At present Associate Editor of the Ohio Farmer.

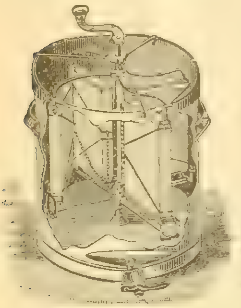
This is a valuable companion to our other rural books. It embraces the experience of forty years of one of our foremost practical agriculturists, who has laid with his own hands over 15 miles of tile.

Price 35c; by mail, 40c.

A. I. ROOT, MEDINA, OHIO.

Stanley Automatic Reversing

HONEY-EXTRACTOR.



As announced in a late number of GLEANINGS, we have leased from G. W. Stanley the right to make his automatic extractor, and we bought from E. R. Newcomb his stock of materials and machines unsold. This stock consists of about twenty-five machines, two and four frame. To work it off quick, and give us a chance to put out machines of our own make, we offer these machines as long as they last, at one-fourth off old prices. We will sell the two-frame machines as they are for $8.00; the 4-frame for $12.00. They are crated ready for shipment, with crank direct on the center-shaft. We will attach our new horizontal gear, as shown on page 14 of our catalogue, for $3.00 each extra.

A. I. ROOT, Medina, Ohio.

LITHOGRAPH LABELS

In 12 Colors, at $1.50 per 1000.

The 12 colors are all on each label. They are oblong in shape, measuring 2⅛x2⅝. They are about the nicest labels we ever saw for glass tumblers, pails, and small packages of honey. We will mail a sample, inclosed in our label catalogue, free on application, and will furnish them postpaid at the following prices: 5 cts. for 10; 25 cts. for 100; $1.00 for 500; $1.75 for 1000. A. I. ROOT Medina, O.,

---

A Four-Color Label for Only 75 Cts. Per Thousand.

Just think of it! we can furnish you a very neat *four-color* label, with your name and address, with the choice of having either "comb" or "extracted" before the word "honey," for only 75 cts. per thousand; 50 cts. per 500, or 30 cts. for 250, postpaid. The size of the label is 2⅛x1 inch—just right to go round the neck of a bottle, to put on a section, or to adorn the front of a honey-tumbler. Send for our special label catalogue for samples of this and many other pretty designs in label work.

A. I. ROOT, Medina, O.

Cash for Beeswax!

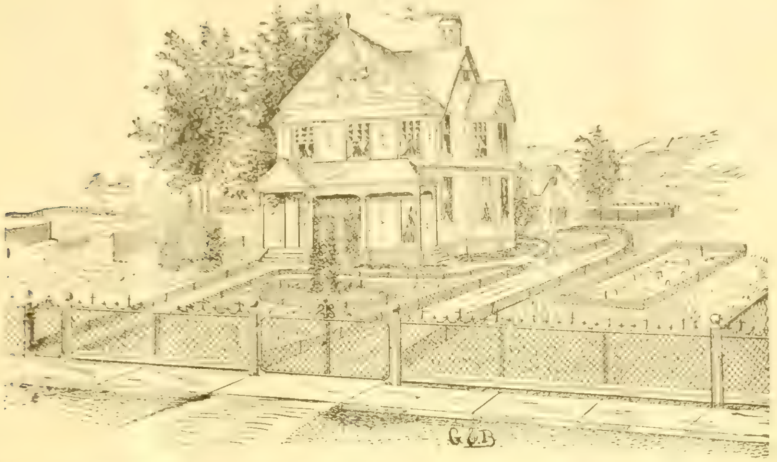
Will pay 23c per lb. cash, or 26c in trade for any quantity of good, fair, average beeswax, delivered at our R. R. station. The same will be sold to those who wish to purchase, at 29c per lb., or 33c for *best selected wax.*

Unless you put your name *on the box,* and notify us by mail of amount sent, I can not hold myself responsible for mistakes. It will not pay as a general thing to send wax by *express.*

A. I. ROOT, Medina, Ohio

STEEL WIRE NETTING and FENCING.

CALVANIZED AFTER BEING WOVEN.



The cut above illustrates some of the many uses to which this wire netting and fencing may be put about the home. You will notice back of the house a poultry-yard. Probably the greater part of the netting heretofore sold has been used for fencing poultry, and nothing can be devised that is cheaper, better, or more durable.

It is the cheapest, costing less than 75 cts. per rod for posts, staples, and all. It will last a lifetime, and never needs repairing, because it can't get out of order. Being galvanized after it is woven, it will never rust. It is easily put up and taken down. It can not be blown down, as the wind goes right through it. On this account you don't need very heavy posts where the fence is used for poultry only. It does not keep out the light and fresh air, so needful to poultry. It is neat and ornamental, and always looks well if properly put up. It is so invisible that fowls can not see the top, and will not fly over. You can see inside as well as if there were no fence at all.

But the uses of wire netting are becoming more and more diverse. If you wish to let poultry run, and have flower-beds, or choice crops that you wish to keep from them, all you need is some of the lightest netting, not over one to two feet wide, stretched around as shown in cut above. This can be attached temporarily to light stakes, and quickly removed when desired. For holding up green peas and beans, tomatoes, and other such crops, nothing could be cheaper or more convenient than the light narrow netting, 12 or 18 inches wide. You notice, by table of prices below, that the light weight, No. 20, 3-inch mesh, is only 60c a roll, 150 ft. long, 12 in. wide. This is indestructible, and, if properly handled, can be used year after year, over and over again. You could not furnish any thing else half as good for the money; and the time of putting this up and taking care of it again after the crop is gathered is insignificant compared with sticks or brush, or any thing else that can be used.

For stock fences the heavier weights are used, or the cottage fencing, which is extra heavy and well made. There are a great many makes of netting and fencing, and it is needless to say that some are inferior to others. We still handle the G. & B. brand, the same as we have always sold since we began selling this class of goods, because we believe it to be the best value for the money of any on the market. The goods for this year are better than ever; being made of stiff steel wire it will not kink and get out of shape so easily. Our contract for the coming year enables us to make very low prices. The 3-inch mesh we are able to offer at about ⅓ less than last year, and other sizes over 10 per cent lower, or as low as we have ever been able to sell it before.

COTTAGE GATES.

There are many sizes of these gates, made with plain and ornamental top, all of which, with many other interesting things, are listed in our 28-page netting and fencing catalogue, mailed on application. Gates like above, 3 feet wide, are worth $2.70 each, 3 feet high; $2.85 for 3½ feet high, and $3.00 for 4 feet, including latch and hinges; with plain top, 30c each less. We do not keep these in stock, but ship from New York or Chicago. This is also true of most of the netting and fencing listed below. We have in stock at Medina all widths of 2-inch No. 19, and also 3-inch No. 20, 12 inches wide, for pea and bean trellis.

We are prepared to make special low prices to dealers, and those who buy in large quantities. On goods shipped from New York or Chicago we must add 25 cts. for cartage on each shipment, large or small. When you pick out from the table what you want, and deduct the discount for quantity, if 5 rolls or more are ordered, then add 25 cents for cartage. The following table gives our net price per roll of all sizes, in lots of from 1 to 5 rolls. On orders for 5 rolls, deduct 5 per cent; 10 rolls, 10 per cent; 25 rolls or more, 15 per cent. Less than full rolls or parts of roll cost double the full roll price.

—Size—		Price 1 roll 150 ft. long and fol'wing widths.

A. I. ROOT, = = MEDINA, OHIO.

To Damn with Faint Praise was evidently not the intention of the Rev. Wm. F. Clarke when he wrote the following, which is clipped from an essay on "Apicultural Literature; Its Influence and Effects," written by Mr. Clarke, and read at the last meeting of the Missouri State Bee-keepers' Association:

"THE BEE-KEEPERS' REVIEW comes nearer to my ideal of what a bee-journal should be than any other as yet extant on this continent. It is not without its faults, but they are mainly those which time and experience will correct. Mr. Hutchinson does not get offended when they are pointed out, but courts criticism and hails correction, deeming it a friendly act to point out an error in opinion, expression, or grammar. He is both courageous and courteous. He is willing to give all a fair hearing. An accomplished bee-keeper: a natural born editor, who takes to literary work as a duck takes to water; a man with the enthusiasm of both his callings—bee-keeping and literature—I see in Mr. H. the rising star of bee-journalism. I am glad he is already so highly appreciated, and hope, as I believe, that his shadow will never grow less. In the BEE-KEEPERS' REVIEW we have the ablest, broadest, most intelligent, manliest, and freest exponent of apicultural ideas that has yet appeared in the western world. These expressions of opinion are spontaneous, unbought, disinterested, and made from no other motive than the promotion of the greatest good to the greatest number of bee-keepers."

Reader, if the foregoing is true, you ought to be a subscriber to the REVIEW. If you think the praise extravagant, then send ten cents for three late but different issues of the REVIEW, and judge for yourself. The REVIEW is $1.00 a year; remainder of the year free to new subscribers for 1893. REVIEW and "ADVANCED BEE CULTURE" for $1.25. Stamps taken, either U. S. or Canadian.

STRAY STRAWS

FROM DR. C. C. MILLER.

THE BEES now spend much time in meditation.

TO PAINT HIVES, a writer in *L'Apiculteur* uses propolis dissolved in alcohol.

THE BRITISH BEE-KEEPERS seem quite enthusiastic about making a good show at the World's Fair.

IF YOU HAUL BEES, do it as soon as possible, so they can be sure of a fly before going into winter quarters.

IT LOOKS STRANGE to see in the French bee-journals the Clark and Hill smokers quoted at the same price, and the Bingham less than the other two.

IF THE HORSE in 40 years has increased from 2:40 to 2:04, Secor, in *A. B. J.*, thinks careful breeding might make the bee beat its present record. And why not?

THE ARTIFICIAL COMB of Pastor Warnstoff, with full-depth cells, it seems, is made with cells on only one side. In Germany it is sold for about 45c per pound.

DO YOU TAKE GLEANINGS and never yet had A B C? Better stop a year when your time is out with GLEANINGS, and get the A B C—that is, if you can't afford both.

FINISHED HAULING bees home Oct. 25. Never had them more heavily stocked for winter; so if I didn't get any crop to sell, at least I don't have to feed. Always something to be thankful for.

PRESIDENT SECOR (*A. B. J.*) would like to see *Apis dorsata* introduced, but adds, "I have no hope that they will prove an acquisition." But he thinks a hundred years of cultivation might mollify their tempers.

MR. EDITOR, do stop letting Rambler tell about those "bands and bands of quail that needed to be put on toast." It makes my mouth water. But then, what does the old bach know about making toast?

CHAS. DADANT thinks nine-tenths of the bee-keepers in France are *fixistes*, or box-hive men, and nine-tenths in this country *mobilistes*, or movable-comb men. I'm afraid he's too complimentary to this country.

"CAN THE FINDER of a bee-tree on my land claim the bees and honey?" is in substance a query in *A. B. J.* The answers are varied enough to make one who reads all of them conclude that, if the finder of the land removes the tree without injuring the honey, he is liable to trespass on the bees.

BOX HIVES have more consideration across the water than here. The *Centralblatt*, an excellent German bee-journal, devotes a page of each number to *beginners* with box hives.

THAT BEVEL EDGE on the under side of the Hoffman top-bar is a good thing to give extra stiffness, only I believe my bees do just a little better when no bevel is cut away at all, but the whole top-bar left ⅞ thick.

"BEES IN THEIR NATURAL homes have the benefit of this capillary force," says friend Scudder, p. 803, speaking of pores in the wood. That points toward the value of porous surroundings; but its force is somewhat impaired by the fact that the bees seem to do all they can to stop up the pores with propolis.

A. TEYNAC reports an experiment in which five colonies with queens raised under violet light stored 5 per cent more honey than five colonies equal in all other respects, except that their queens had been raised under ordinary light. It reminds one of the blue-glass craze that swept over this country a few years ago.

MY PATCH of Chapman honey-plant, after being well cultivated till it had a good start, was left untouched till this year, when a good crop of hay was taken from the ground with never a stalk of the honey-plant. It will not hold the ground any more than Indian corn. As a honey-plant I doubt its great value, even if it would grow without cultivation.

MAKE SURE THAT MICE do not make havoc with bees wintered in cellar. Close up all entrances with heavy wire cloth, three meshes to the inch. Don't wait till they are cellared, for, as soon as the bees become dormant with cold, the mice will take up quarters in the hives, and it's no good to shut them up after they are in. Shut them out while the bees are lively.

AN ESTABLISHED REPUTATION is worth something among bees as well among men. When a colony is set in a new place, or brought from another apiary, you need to give it more protection against robbing than another colony of equal strength that has always been there. Bees bent on mischief will give it a thorough trial till they find what stuff it is made of.

DID YOU EVER NOTICE that, if you put brood-combs in an upper story, not allowing the queen to go up, not only will the cells become emptied of brood but of pollen as well? Before the days of excluders, I kept upper stories for extracting, a small auger-hole between; and, no matter how much pollen was there, it gradually disappeared, although there was no brood present.

THAT HOFFMAN-FRAME trouble, that friend Peete so graphically describes on page 798, I do not believe will prohibit their use in his locality. In the spring, when the propolis is hard enough for his "toy pistol" act, it will not be such a tremendous job for him to scrape off the surplus propolis. But I'm just a little skeptical about that knife-blade edge being best in that locality—or anywhere else.

CHAPMAN HONEY-PLANT has quite a "boom" in *Deutsche Imker*. Five hundred bees visit each plant daily in good weather; cultivated for bees alone it pays a high rent; it is an ornamental plant; after blooming it makes good fodder for stock, and it grows and flourishes without care. A fine showing; but among all the thousands in this broad land who tried it, if there is a single one who thinks it of value enough to occupy the ground will he please arise and be counted?

LANGSTROTH'S REMINISCENCES.

THE CIRCUMSTANCES OF HIS CONVERSION IN COLLEGE.

During my college course my studies were considerably interrupted, and once entirely suspended, by severe attacks of melancholia, a full account of which I have already given to the readers of our bee-journals.

Until my senior year I felt no interest in personal religion, and yet it was my special good fortune to secure the friendship and intimacy of the most religious men in my class, some of whom assured me that my course in the rebellion had won their admiration and respect. Associated intimately with us were quite a number who did not call themselves Christians. I believe that I can truly say that we aimed to cherish a high sense of honor and purity, and that our mothers and sisters might have heard without a blush our most private conversations. Since I have mingled freely with men, I am quite persuaded that what I have said of the tone of our conversation is very far from being a common experience; and I grieve to say, that, even among men whom the world calls respectable—nay, even among those who call themselves religious—conversation may too often be heard which is very far from promoting that purity of heart enjoined upon us by the Savior.

In our senior year, an Amherst student named Peter Parker joined our class. Although not distinguished for scholarship, he was remarkable in awakening a deeper religious interest among Christian men, and in acquiring the respect of many who had hitherto been indifferent to religious considerations. I was then living without prayer, and without reading my Bible. I was taken sick, and Mr. Parker visited me. His prayers and conversation moved me much; but as soon as I recovered I tried to avoid him as much as possible. Joining me one day after recitations were over, he proposed a short walk. I knew very well what his object was; but I consented, fully intending to get rid of him as soon as possible. We walked and we talked, until moved, as I now believe, by the Holy Spirit, I went with him to the room of Prof. Goodrich to ask him what I must do to be saved. This holy man had been for some time unusually earnest in his prayers for a revival of religion in Yale College. He seemed to feel that he could not endure the thought that our class should leave college while so few gave any evidence that they meant to consecrate themselves to Christ. I was the first one who had sought his counsel. How he talked with me, how he prayed with me, how he wept for me and with me, only those who knew him well can fully understand. I left his room, feeling that I could never rest until I had found forgiveness and peace in a Savior's love. The blessed work spread from one to another. Noah Porter, afterward so eminent as president of Yale College; Lyman Atwater, in time to become a familiar name in the classic halls of Princeton, and many others prominent for scholarship in our class, were brought out of darkness into the marvelous light of the gospel of Christ. Nearly one hundred and fifty hopeful conversions were numbered among the college students, and multitudes from the residents of New Haven. Our class, which was so soon to finish its course, had its destinies entirely changed by this gracious work of the Holy Spirit; and if doubters of revivals of religion could read the life-record of those who were then converted, few of them, I believe, would be doubters any longer.

There was one classmate from the South, a gentleman by birth and education, of the name of Seddon, quite noted for his profanity and boasted infidelity. When reproved by his associates he would readily admit that it was an ungentlemanly practice to swear, and then with an oath say that he could not help it. Coming one day to my room he spoke to me substantially as follows:

"Langstroth, I see that a great change of some kind has come over you, and I want you to tell me frankly all about it." After listening with deep attention he said, "You know that I have called myself an infidel; but I confess to you that I desire to believe in the truth of Christianity. What books would you advise me to read?"

While recommending "Paley's Evidences of Christianity," I said to him, "Seddon, by all means read the Bible." Soon after, he came to one of our prayer-meetings. Only a few, however, knew for what purpose he came. Many thought that he sought to learn how to make the scoffing prayer-meetings which they were holding a greater success. With most he gained as little credence as at first Saul of Tarsus found among the persecuted Christians. Not long after, he invited me to his room; and when I asked him if he had read Paley's Evidences he said that he had not, for he never was sincere in his professions of infidelity. He then handed me a Bible, and asked me to read what was written on one of its blank leaves. It was the words of a loving Christian mother, expressing the hope that her dear son would make that book the guide of his life. "My mother," said he, "gave me that book when I left home for college, and I promised her to read it every day. Until quite recently it has lain entirely neglected at the bottom of my trunk. Langstroth, can any one who has such a praying mother as I have—can any one who has daily seen the godly life of such a mother as mine—ever come to believe that there is no truth in the Christian religion?"

O Christian mothers! if you have sons who have strayed ever so far from the paths of righteousness, get new strength as you read this story. The cords of a praying mother's love were twined around the heart of that poor boy, even in his hours of deepest degradation, and at last he was saved. He did not live to complete his college course, but died full of faith and the Holy Ghost. Before his last sickness, conversing with him alone in his room, I asked him, "Seddon, have you never been tempted to swear since you became a Christian? Don't you remember you often said that you could not help swearing?" With a smile upon his face he pointed to the tongs which lay against the stove, and said, "Langstroth, not long ago I had a very large fire in that stove; and, thoughtlessly taking hold of the tongs, they blistered my fingers; and as I flung them from me one of the old horrid imprecations came to the very tip of my tongue; but, thank God, I was able to choke it down."

I joined the College Congregational Church in the spring of 1831, and, after graduation, entered the Theological Seminary of Yale College. My father's business had now become so much embarrassed that he could give me no further assistance. I knew how many applicants the American Education Society had from candidates for the ministry who were just beginning to get a liberal education, and I felt strongly persuaded that if, with a college course, I had not sufficient energy to complete my theological studies from my own earnings, I gave but poor evidence of having any call to preach the gospel. I therefore took classes in some of the schools for young ladies in New Haven while I pursued my theological studies. Afterward I taught in a school opposite West Point, and, in the fall of 1834, became a tutor of mathematics to the freshman class in Yale College.

While in the tutorship I had some very pleasant experiences, and never suffered, like many of my predecessors and successors, by being smoked out of my room or having my windows broken, etc. I attribute my escape from these and other annoyances to a somewhat natural courtesy of manner, but very largely to the strong personal interest which I took in my students. If I found any of them getting behindhand in their studies, I was always ready to offer them private instruction, without any charge. All such kindness was fully reciprocated, as the following incidents will show:

In winter, prayers and recitations were before sunrise. I had for some time been feeling quite unwell, and one morning I overslept myself. Roused by a knocking at my door, I opened my eyes and realized at once that I was late. I dressed as fast as I could, and on opening my door I found a deputation, who politely informed me that my class was waiting for me, as they knew that my state of health had probably caused me to sleep over. By immemorial custom, for the first time, I believe, broken over, when a tutor failed to be on hand his class waited about five minutes, when, if he did not appear, they rushed out of the room, filling the adjoining halls with yells of exultation which proclaimed their tutor's delinquency to all in reach of their voices. It seems that, after waiting for me the usual time, just as they were about to disperse, a student whom I had befriended plead with them to hold on for a moment, reminding them of my kindness and courtesy, and proposed that a deputation be chosen to inform me that they were still in the recitation-room.

A few weeks later the same experience from a similar cause befell me, and again a deputation from the class waited upon me. If the first occurrence was a subject of more than common talk among instructors and students, the second one attracted much more notice. After I reached my class I thanked them with deep emotion for their kind consideration, but assured them that, if I made another sleep-over, I believed they would be justified in following the old custom. L. L. LANGSTROTH.

Continued.

SUGAR-FED HONEY.

WHAT THE DADANTS THINK OF IT.

What is honey? Prof. Cook answers: "Honey is digested nectar. Every one understands that honey is the liquid product of bees, which they store in the cells of their combs. . . . That honey is digested nectar is just as true, although not as evident to the unlearned. . . . Digestion is simply changing our food so that it can be absorbed. . . . Many substances, like albumen and cane sugar, . . . must be changed — digested — before absorption can take place." (Something in defense of sugar honey), *Bee-keepers' Review*, page 262.

According to the above quotation, all the savants who do not accept this assertion of Prof. Cook, that honey is digested nectar, even *the best authorities in chemistry*, in Europe as well as in America, *are unlearned.* To my knowledge, Prof. Cook can boast of being the first who wrote that *the more or less complete* change of food by its mixture with the gastric juice is digestion, for the simple fact is against such a theory. As soon as some cooked starch is introduced into our mouth and masticated, our saliva mixes with it. Then this starch, before going down into our stomach, is *more or less* transformed into glucose by the chemical action of our saliva.* It is the same with the nectar gathered by bees, which is *more or less* transformed in their honey-sac, by the saliva or juice of their glands, before going into their true stomach.

Of course, as no savant will say that the starch is digested before going into the stomach, I can not see how it can be admitted that the nectar is digested before going into the true stomach of bees. I say *true* stomach, for "the honey-sac acts as a temporary reservoir for the collected nectar" (Cowan). Furthermore, according to the well-known English chemist, Bloxam, digestion is the change of the food into chyme by the gastric juice, the bile, the pancreatic juice, the intestinal fluids, and the separation and absorption of the chyle contained in the chyme.

Milne Edwards, of Paris, wrote that digestion begins by the mastication of the food and ends by the absorption of the chyle and the defecation.

I could quote scores of savants who agree with the chemists just named, and I challenge Prof. Cook to find any one of them teaching that digestion consists only in the mixture of the food with the gastric juice and its more or less complete transformation. But this criticism is not the main purpose of my article.

Prof. Cook writes: "If honey produced by feeding bees with cane sugar is entirely wholesome, of which there can be no doubt; . . . if our best chemists class it with the best honey from choicest plants, does it not stand to reason that it can be, may be, and, we say, *ought* to be, a product with no tarnished fame or reputation? . . . Let us not cry knavery or fraud, but candidly investigate the matter; and if this course does offer a right and justifiable means of increasing our profits, let us adopt it" (*Review*).

The main argument of Prof. Cook is, that such product is wholesome, and that the chemists class it with the best honey from choice plants. Let us suppose that I am so dextrous in counterfeiting greenbacks that all the most learned chemists and all of the best engravers pronounce my papers as true, would it follow that I am right and honest in making and putting them in circulation? It would rob nobody, since every one of my greenbacks would be accepted as the ones issued by the government. No doubt I would rob the nation of their value; but the man who would sell sugar syrup as honey would not only get money on false pretense, but would make, also, a disloyal competition with the honest bee-keeper. He would not be more honest than a money-counterfeiter, and he would ruin our business by destroying the confidence of our customers. So Mr. Cook would have acted wisely if, instead of boasting, in several papers, of the results of more or less scientific tests, he would have kept them to himself. But neither science nor practice has yet given its last words on this question. Furthermore, my experience in this matter inclines me to predict that the adulterators will meet more difficulties than are anticipated; yes, even if those who try do not succeed, it is certain that the unwise articles written by Messrs. Cook and Hutchinson, far from benefiting the bee-keepers, will have a bad influence on the market.

---

* Dictionnaire de Médecine de Littré et Robin.

I am glad to see our old friend Langstroth agreeing with us on the dishonesty of selling sugar syrup as pure honey.

CARDINAL FLOWER (LOBELIA).

As a confirmation of what Mr. W. E. Gould wrote in Gleanings, page 800, I can say that there is, near the short path leading from our home to our shops, a plant of cardinal flower. I saw it every day, for years, during the flowering season, yet I have never seen a single bee on it. Nevertheless, it gives very small seeds in abundance, so there is a proof that it doesn't need the visits of bees to be fecundated. The lobelia family contains very poisonous varieties; among them are the *syphilitica* and the *inflata*, or Indian tobacco-plant. Of course, such qualities can not attract bees. Chas. Dadant.

Hamilton, Ill., Nov. 3.

[Not knowing that the elder Dadant was preparing an article on the subject, Camille P. wrote the following:]

Friend Ernest:—No, no, no! a thousand times no! You are not wrong in your position against the selling of sugar fed to bees under the name of honey. Such a thing is no more nor less than adulteration, unless the consumer is told what the article is; and whenever he is told what it is, he will be unwilling to pay honey prices for it, or, for that matter, to buy it at all. Hutchinson is doing the reverse of what he should do if he wants the support of the honey-producers. It would be just as wrong to sell sugar under the name of honey as it would be to sell honey-dew under the name of clover honey. Let every tub stand on its own bottom.

Yours for true honey,
Dadant & Son.

[It seems to be understood by both A. I. R., elsewhere, and the Dadants, that Mr. Hutchinson and Prof. Cook intended that this sugar comb honey should be sold as the pure product of the hive. The writer feels sure that both intended that it should be sold for only what it is. Mr. Hutchinson's editorial, however, on page 274 of the *Review*, which we publish in another column, rather leaves the impression (not intentional, we are sure) that the sugar comb honey was to be sold as the pure article from the flowers—that is, no statement to be made as to whether it was pure honey or something else. From what correspondence we have had with Mr. Hutchinson relative to the same point, we are certain that he did not so intend it; and while we disagree with him as to the probable tendencies of the advocacy of sugar comb honey, we feel it but justice to him that this statement should be made.

It seems to us there is one point, incidentally referred to by C. P. Dadant above, that has not been sufficiently brought out; and that is, if sugar comb honey can be produced at a cost of $7.50, and sold for $20.00 (as alleged by Mr. Hutchinson in another column), that, sooner or later, competition will bring the cost of production and the selling price nearer and nearer together, because, on the assumption that the consumer *knows* what he is buying, he will very soon figure out for himself the difference between cost and selling price. So great a margin could not possibly be realized unless the fact of the origin of the sugar honey were concealed, and the honey sold as a pure article from the flowers; hence we argue that large profits can not be obtained, except dishonestly. We know Mr. Hutchinson well enough not to question his motives, and, for the most part, his good judgment; but we feel strongly impressed by the fact that dishonest persons will make bad use of the knowledge; and that the daily papers, which have no love for nor interest in our pursuit, will make "capital," to the serious detriment of the interest of the bee-keeper.

Some may wonder that we should give so much space for the discussion of a subject that, we fear, presages injury to our pursuit; but now that the discussion has *already* been opened in another journal, and the practice of feeding bees sugar syrup to produce honey favorably commented on, is the reason why we feel it our duty to use our influence against what we consider a dangerous position on the part of our esteemed cotemporary the *Review*; for among our bee-keeping exchanges there is no paper that we prize more highly.] E. R. R.

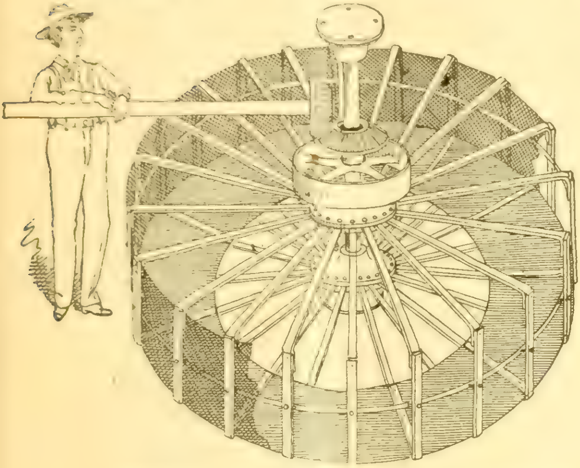
THAT MAMMOTH STEAM HONEY-EXTRACTOR.

A. W. OSBURN, OF CUBA, EXPLAINS ITS MERITS.

Mr. Editor:—That steam power extractor has been in every sense satisfactory. The points of excellence about my extractor (when run by steam) are so many that, to properly describe them all, would make this article much too long for Gleanings, so I must content myself by naming a few of them only.

I will speak first of the superior work that it does, which is all that any one could desire; in fact, it does the nicest work of any thing I ever saw in the shape of an extractor. Why, I will try to tell you. The upright shaft being fastened solid, both at top and bottom, there is no tremble nor shake to the reel; and it matters not whether the reel is evenly loaded or not. If it can not move at top or bottom, it must run true. Now, it will not take a man long, who has extracted much honey, to see the great advantage in this, in more respects than one. First, on account of the reel running so perfectly true there is no jar nor shake to the comb; and on account of this, the machine can be run much faster, without injury to the comb; and where there is brood in the combs, not one-half as much brood will be thrown out by my machine as with the ordinary hand machine, because the honey, being heavier than the larvæ, goes out first, and no one can judge or tell any thing about what the difference is in the work done by my steam power extractor, or that done by a hand machine. When I tell you what I have said is true, and you take into account the great difference in centrifugal force, my reel being 7 feet 3 inches in diameter, and making 260 revolutions per minute, the centrifugal force of it is 13 times greater than one 2 feet across, making the same number of revolutions, and still it throws out nothing like the amount of larvæ that the hand machine does. Does it throw the honey out? Yes, it does, better than any thing else a man ever saw in the shape of an extractor; and is it not a little more pleasant and satisfactory, too, to sit down and rest while the extractor and engine are doing such satisfactory work for you? I think it is. I have had as good men to work for me as ever turned an extractor; but I never had one that was willing to kill himself trying to get the honey *all* out the combs with a hand machine.

My extractor is not a reversible machine, as you know, and I am not disposed to say any thing of the reversible machines, any more than that I have never had them do work so satisfactory for me as the non-reversible ones. I have used two different makes; one I owned, and the other I did not. There is just as much difference in extracting honey with my extractor run by steam, and undertaking to do the same work with a hand machine, as there is in sawing wood with a bucksaw, or doing the same work with a good steam outfit. I have probably turned an extractor to throw out about as much honey as most men; but I don't want any more of it. I am perfectly willing to let some one else have that pleasure and honor.



OSBURN'S MAMMOTH HONEY-EXTRACTOR—INSIDE VIEW ONLY.

Now in relation to the cheapness or the cost of the two; i. e., steam or hand power, to operate. To run my extractor properly, say from 7 in the morning till 4 in the afternoon, will take not to exceed 40 cents' worth of coal; oil, 5 cents, and in that time you can throw out 10,000 lbs. of honey if you have it to throw out. But suppose you have but 2000 lbs. to get out. Is it not much pleasanter to do it by steam power than by hand? Was not the first extractor ever made a great improvement over the boy's way of getting the honey out of the comb by swinging the comb fastened to one end of a string over his head. Any man will say yes. I will figure the cost of the two methods, steam or hand power, from our standpoint here, where, in the best localities, hundreds upon hundreds of colonies can be kept in one apiary, and such a plant as I have, is so far ahead of hand machines that there is no comparison between the two. I will let you figure the cost in your country, where only small apiaries can be kept in a place, and hand power and small machines are always used.

A. W. OSBURN.

Punta Brava, Cuba, W. I., Oct. 19.

[Very recently we built a mammoth honey-extractor, for a party in Cuba, the same constructed after the manner of the one used by A. W. Osburn. After it was completed we took a photo of it, with a workman standing beside it; and the result given above will give the reader some conception of its size. The engraving shows the internal arrangement for extracting 21 combs at a time. Although Mr. Osburn does not say so, we presume the same is set up in a large wooden tank, the upright shaft being socketed to the ceiling, and to a substantial bearing in the bottom of the tank. A pulley is supposed to be put on the end of the horizontal shaft, or about where the man stands. This pulley is then connected with the engine direct. The other pulley, just below the beveled gear, is designed to receive the brake, as so large a machine, when in full motion, would not stop, probably, under a minute or two, unless braked down. The upright shaft is 3 inches, and the horizontal 2$\frac{7}{16}$ in diameter. The supporting-arms are rods of steel $\frac{3}{4}$ inches square, making the whole inside reel 7 feet 3 inches in diameter, and the beveled gear is 13 inches in diameter. The combs are held in a perpendicular position by an inside ring midway between the bottom and top of the reel and two inches from the wire cloth. To reverse, the combs must be lifted out in the good old-fashioned way, and set in again the other side to.

Mr. Osburn is probably correct in regard to this machine's freedom from vibration. Other things being equal, the larger the reel the less the vibration due to any slight eccentricity. It seemed to us it was strong enough and heavy enough to hold a man's weight at its periphery, and we have no doubt that it will do its work perfectly. Of course, such a large extractor as this will be useful in only a very few localities in the world—such localities as would furnish nectar-bearing flora for five or six months in the year. We doubt whether it would be practicable in many places even in California. For the great majority of bee-keepers, the two-frame extractor is sufficient; and even four and six frame reversible extractors have a capacity ample for the needs of the most if not all of the largest extracted-honey men in the United States.]

SOMETHING FURTHER ON THE INTRODUCING SUBJECT.

FREELY GIVE, FREELY RECEIVE.

Well, well! it seems that Doolittle's article on page 617 was read with a "relish" by Dr. Miller; and if my correspondence is any criterion to go by, that article was read with much "relish" by many others. It is "kinder funny" that, when a "man is down," folks will all "prick up their ears" and be more interested in his *being down* than they are in the man, or in all he has done for the good of the world in all of his previous life. Let a minister of the gospel fall into an error, and how the newspapers of the land will publish it, so that all eyes will see it, while all of his life may have been spent in doing good up to that time, without a single word of encouragement, or words of cheer being said to help him bear the burdens the Master has enjoined upon him, or so that he might have shunned the pit into which he fell, or been of still greater usefulness in the world. What I have to say in this article is not said in a fault-finding spirit, but with the hope that we as bee-keepers may be led into a broader plain, and up to a higher elevation along the line of what shall be the "greatest good to the greatest number."

Soon after that article, on my failure to introduce a queen, appeared in print, I began to be showered with letters, and I almost wish it were the proper thing to give all of those letters, with the names attached to them, in the columns of GLEANINGS. It would seem that many—yes, very many—have forgotten the great doctrine of the "brotherhood of man," and the one desire which, taking possession of the hearts of many of the people, seems to be to get all they can by hook or crook of the things of this world, no matter what becomes of the poor fellow-beings from whom they can obtain it. I had prided myself in the thought that bee-keepers as a class were not so selfish as the rest of the world; but since that article I have about come to the conclusion that they are made up of about the same material as the rest of mankind. Some of the letters received were kind and sympathizing; some were glad I wrote as I did, for it expressed their condition exactly, and, as Dr. Miller says, "gave them a bit of comfort to think that others besides themselves are sometimes beaten by the bees." Such as these gave me comfort; but others were very different. As a sample of one class, I give this from one of the largest queen-breeders in the world: "Ah, ha! I see by GLEANINGS, page 617, that Doolittle has forgotten how to introduce queens. Let me say that I have not lost a single fertile queen by introducing in five years. Probably you know that certain conditions cause failure." And that was all there was relative to this subject of introducing queens in that letter. As a sample of another class I give this: "I see in GLEANINGS for Aug. 15, over your signature, a piece in which you say you do not know of any sure, easy way of introducing queens. I use a plan that is sure and easy, and I have never failed myself, nor did I ever hear of any one else failing that introduces as I do. If you would really like to know how to introduce a queen easily and safely, and without a failure, I will tell you how for a small consideration. I should like some Italian queens for my own use; and if you have them you can cheaply pay me for my advice."

In 1870 I wrote my first article for publication, and my bee-keeping life is familiar to all the readers of GLEANINGS and other bee-papers; for I have never done "any thing in a corner," but have given all of my successes and reverses, together with all my plans and methods, to the public as freely as I would to my own family, always realizing that, through the philanthropy of others, I have attained the success I have achieved. After having thus given all that I know of bee-keeping to the world, I am asked by some to give still further of what I have wrought out by "sweat and muscle," to buy something which should have been as freely given to the world as I have given what I have done, and am laughed at by others, and told that "certain conditions cause failures," without even a hint at what those conditions are or how they may be avoided. When a young couple start out on life's voyage they put all their energies together, that a comfortable and happy home may be made. The husband does not try to defraud or take advantage of the wife, nor the wife the husband; but both work together for the accomplishing of the same object—the blessedness of a comfortable home. If God gives them children, both parents and children work together to make both life and home a pleasure. The children do not try to defraud the parents nor the parents the children, but all work together for the happiness of *all*. Now, I wish to say that what is good for that family, as pictured above, is good for the great family of bee-keepers in this nation and in the world. Still further, what is good for the family is good for a township; what is good for a township is good for a county; what is good for a county is good for a State; what is good for a State is good for a nation; and what is good for a nation is good for the world. May God help us to get out of this state of not loving our neighbor as ourselves, and come out into the glorious light and liberty of the gospel of our Lord and Savior Jesus Christ. "Freely ye have received, freely give."

Before closing I wish to say that two or three very kindly wrote out their plans in full and sent them me, telling just how they introduce queens. These I wish to thank, especially so as they give me the privilege of having the plans published to the world through any paper I might wish to give them. The reason I do not give them is because the essential features of these plans have appeared in our bee-literature of the past; but the willingness they showed is just as deserving as if the plans were new. G. M. DOOLITTLE.

Borodino, N. Y.

[Friend D., like yourself we have letters every little while from people who say they have not lost a queen in introducing, in five years, or that they have not lost one in a hundred; and it always troubles me to receive such letters, knowing, as I do, how frequently the very best of us make sad failures. In fact, there is hardly a thing laid down in bee culture that is not likely to turn out so contrary to our previous experience or expectation that the whole industry seems to be a series of surprises, and they are not always "happy surprises" either. I think that, if I were to set about it in real earnest, I could introduce 25 queens, without a failure; but I should have to work hard and take a good deal of time with some of them. In introducing imported queens, where they are worth several dollars each, we have abundant experience in the matter—yes, experience when it is a pretty serious thing to lose even one. So far as I know, no plan has ever been discovered that is infallible; and these people who claim that they have something of the sort that they can not communicate unless they receive a consideration should be shunned at the outset as bad and wicked; and the poor fellows seem to be so much behind the times that they do not even know that most good people read their real motives at a glance.] A. I. R.

PRIORITY OF LOCATION.

DR. MILLER ANALYZES THE POINTS BROUGHT OUT BY W. G. HEWES.

The problem you have tackled on page 802, Mr. Editor, is by no means an easy one. You say you would be mad if you had found a grand location for bees, and some other chap should bring 100 colonies and settle beside you. But what does that prove? Wouldn't you be just as mad if you had found a grand location for a shoestore, and, after settling there, the other chap should come and scoop you out? Don't you think "some moral right is due *shoe*-man No. 1 for discovering for himself a good field" as well as the *bee*-man? Please don't be too one-sided.

Take the case that friend Hewes hints at. Mr. Lazicus has struck a "grand location," capable of giving in a good season 20 tons; but, through shiftlessness and lack of sufficient bees, he gets only one-tenth that amount? Is the whole of creation to stand off and look on while he does the dog-in-the-manger act? Will it not be better for Mr. Upandatit to sit down beside him and get that other 18 tons—that is, unless he can find an unoccupied location where he can get 20 tons?

But suppose Mr. Upandatit is settled on his 20-ton spot, and Mr. Lazicus hears of his big yelds, comes along with 100 colonies, and sits down and gets 2 tons of the crop. How would Mr. U. like that? He could hardly object, if friend Hewes is correct in saying, "An inexperienced person generally manages so badly that what little honey he gets makes no difference in the other's crop?" But isn't that talking somewhat at random, friend Hewes? Suppose Mr. U. has enough bees to lick up all the nectar that is produced, and gets a crop of 20 tons. Then suppose Mr. L. comes with his 100 colonies and gets off the same ground a crop of 2 tons. Is there any kind of management on the part of L. that will make the difference to U. any less than 2 tons?

But it must not be forgotten that L.'s bees must have something for their own consumption; and as it is estimated that each colony consumes about 60 lbs. per annum, it will take 3 tons for 100 colonies. That 3 tons, added to the crop of 2 tons, makes 5 tons that L.'s bees have gathered from the flowers. Will you please tell us how L. can manage so badly that there will not be just 5 tons, clean cut, taken out of U.'s 20 tons? I think you would object with some force, probably with a force of about 5 tons, against the coming of L.; yet it is difficult to see how, in the first case, you are going to let U. come in on L., and in the last case reverse the matter. Who is going to properly draw the distinguishing line? I am not saying which is the right way; I am only showing the difficulty in the case.

The ground is taken, that, whenever a man can better himself by it, it is his duty to enter a field occupied by some one else, on the ground that "self-preservation is the first law of nature." But the "first law" is not always the *best* law. There is a higher law that says, "Thou shalt love thy neighbor as thyself." Moreover, it is not always true that "self-preservation is the first law of nature." It is not true among bees. Every worker-bee is ready to lose its life for the sake of the rest of the colony. Its motto is not "self-preservation," but "the greatest good to the greatest number;" and are not our civil laws based on this very motto?

With this motto in mind, I think it will not be so very hard to see why the case of the bee-keeper is not exactly parallel to that of the merchant. Suppose that, in a village, there is one merchant and one bee-keeper. Another merchant takes up his abode in the village, and also another bee-keeper. Upon which accession will there be the most self-congratulation among the villagers? Hear Mrs. Jones say to Mrs. Smith, "Isn't it nice that we have a new store? The old store had no competition, and we just had to pay whatever they asked. Now we can have our choice of the two places." But you will hear no such remark about the new bee-keeper, for, if the ground was fully occupied by the first man, he can not and will not sell honey any cheaper than before, for he can not afford it so well now. It is very true, that the first merchant could afford to sell goods cheaper when he held the ground alone, but, as a rule, he does not till competition compels him, consequently competition secures "the greatest good to the greatest number."

But Mr. Hewes says, "I can not see why a bee-keeper should be more exempt from competition than a merchant." Candidly, I can't either. Is he? One year I raised half as many strawberries as we could use in our family. My neighbor did the same. Each of us ate all we raised. Was there any competition between us? Certainly not. The next year we raised more, and used them up the same way. There was no more competition than before. The succeeding year we raised them by the acre, and, of course, sold the most of them. Then competition began, and each of us had to sell our berries for a little less than if only one of us had been in the field. Do you notice that there was no competition till there was selling? Our *raising* berries did not make competition, but our *selling* did. Is it not the same way with honey? I never knew the time, since I commenced the business, that I had not competition. Whether I sold half a pound to a home customer, or shipped a carload to a distant point, there were always others ready and anxious to sell to my customers, and competition with them always influenced my price. But if a man comes in and spoils my field for both him and me, I don't call that competition any more than I would call it competition for a merchant next door to another to pile up empty boxes on the sidewalk so that customers could hardly enter either store.

To be continued, if the editor permits.

Marengo, Ill. C. C. MILLER.

[There, now, doctor, your logic has mixed us all up; in fact, we've almost forgotten on which side of the fence we were. To tell the truth, we tried to be *on* the fence. At all events, we shall not try to collect ourselves till we hear from you again on the subject.]

THE NEW CRANE SMOKER.

ITS CONSTRUCTION, AND HOW IT CAME TO BE INVENTED.

For many years I have felt that there was need of a better smoker than any now offered in our bee-journals. Broken springs, burned bellows leather, clogged blast-tubes, burnt clothing from sparks that escaped from the base of the fire-barrel, a large hive containing a good colony of bees burned up, the scarred trunk and limbs of an apple-tree beneath which it stood, and, above all, the constant feeling that followed me that I ought to get a larger supply of smoke with a stronger blast for the effort I made, set me to thinking whether a better smoker could not be made. As the smoker is the most important tool of the apiarist, it is very desirable to have it as near perfect as possible. Even if it costs a little more at first, the time saved will soon pay the difference. Not only do we want an instrument that will not easily get out of repair or scatter sparks, but we want one that will give a large or small volume of smoke at the will of the operator.

Some years ago I constructed a smoker with two leather valves, the upper one placed in the mouth of a wooden air-flue connecting with the base of the fire-barrel. While this smoker seemed to give me more smoke, and a stronger blast, than any other I had seen, it did not fully satisfy me. Having to make some new ones last winter, I began anew to study the whole question, giving it more time and thought than I had before been able to do. I made a great variety of valves and connecting-flues. What I wanted was a smoker easy to operate, that would not readily clog with soot or creosote, or get out of repair, and that would give the strongest blast and volume of smoke possible. The results of my efforts are before you.

A 3-inch barrel is fastened to a 6x8-inch bellows, by two pieces of ¾-inch hoop iron. Each piece is bent about ¾ way around the barrel, and fastened by wire, and then bent at such an angle as to give the greatest strength, and then bolted to the bellows. The bellows springs are on the outside, one on each side of the bellows, and fastened by metal clasps, and can be removed at will, and made stronger or weaker to fit the hand of the operator. They are so made that it may be said they will neither break nor wear out. For my own use I fasten a hook to the small end of the bellows between the springs to hang the smoker to the edge of the hive while at work, and find it very convenient.

To secure the strongest blast of air through the fire-barrel, filled with all sorts of combustible material, and, perhaps, a layer of ashes and spent fuel upon the grate, it is necessary to have a closed air-flue between the bellows and base of the fire-barrel. But if we connect with a metal tube, large quantities of smoke and sparks will be drawn into the bellows when it opens, and that will soon ruin it, besides causing the fire to go out unless the bellows is kept in constant motion. There appear to be only two ways of getting around the difficulty: Either we must use a blast-tube partly or wholly cut off, which does not entirely prevent smoke and sparks from being drawn into the bellows, and, besides, appears to weaken the blast, and permits sparks to drop upon the operator or hive-packing, or we must place a valve in this blast-tube, or air-flue, in such a way that it will open when the bellows closes, forming with the air-flue a closed passage from the bellows to the fire-barrel, and then instantly close to prevent smoke being drawn into the bellows.

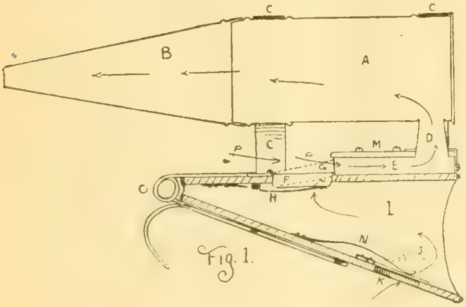


Fig. 1.

SECTIONAL VIEW OF CRANE SMOKER.

An illustration of this principle is seen in the diagram, Fig. 1. The slightest pressure upon the bellows opens the valve F, near the center of the bellows, and, with the air-flue E, forms a closed air-flue, or blast, from the bellows to the barrel. As soon as the pressure is removed, or the air in the bellows exhausted, the valve instantly closes, thus preventing any smoke from entering the bellows. The valve, being closed when the smoker is not in use, permits a sufficient draft of air through the open mouth of the air-flue to keep the fuel burning in good shape. This valve is hinged at one end, and plays loosely into a slot, N, Fig. 2, on either side of the mouth of the air-flue. That no air may escape around the valve, a piece of flexible leather is stretched across the valve on the inside of the bellows, with a hole through it opening into the valve.

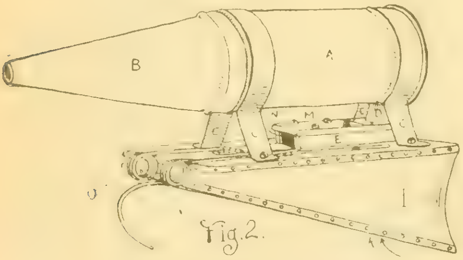

Fig. 2.

THE CRANE SMOKER.

The grate is so constructed, that, with the strong blast, I have had no trouble with ashes or sparks coming down into the air-flue. The diagrams make the working of this smoker so plain that I need not explain further. Its advantages must be evident to any experienced bee-keeper. It will be seen that no smoke or sparks can be drawn into the bellows, nor can any sparks drop or fly from the base of the fire-barrel into the clothes of the operator nor into the packing of the hive.

I have not been troubled with any creosote—that sticky, tarlike substance that, in most smokers, runs down the sides of the smoker and over your hands, not unfrequently soiling the sections. Almost any kind of fuel can be burned in this smoker, after a fire is once started. My assistant told me that he worked my smoker for half an hour on nothing but green grass. I would not, however, recommend grass as the best fuel. This smoker does not easily get choked with soot or creosote; yet, if in careless hands, or from long use, the air-flue or metal valve gets coated with soot it can be easily and quickly taken apart and thoroughly cleaned, so it will work as well as when new; and although so easily taken apart, when put together it is one of the strongest smokers made. The barrel can, in a moment, be taken off when worn out, and replaced with a new one.

More important than any thing else, so far as my experience goes, this smoker will throw a much larger volume of smoke with far greater force, with the same kind of fuel and the same effort, than any other smoker. It is not always necessary to use large quantities of smoke, nor desirable; but when you do want it, you are apt to want it very much; besides, one can work much more rapidly, if he has an abundance of smoke in reserve, than without it, and time is money.

Some time ago I was at work opening a hive, when the bees became very angry, and declared war in earnest. I closed my eyes, took my smoker, and gave a few puffs of smoke about my person. On opening my eyes I could not see even into the hive I had open before me, so dense was the smoke. In a moment more the smoke drifted away and I was left to finish my work without interruption, and was master of the situation.

In this section it is rare that we have much honey to be gathered after basswood bloom; and in a poor season, like the past, almost every hive has to be fed to fit them for winter. How much, can be told only by careful examination, as bees are mostly in large hives, and weighing them is impracticable. Heretofore I have found it very difficult to look them over until cool weather, on account of robbing. This year I looked over a number of yards of bees; and although the weather was warm most of the time, and robbers very abundant, I lifted almost every comb in every hive without any serious trouble from robbing. In fact, I worked with as little fear from robbers as I usually do in a good flow of honey. An assistant with a good smoker in hand made robbing an unequal game; and after trying it for two or three hours each day they would usually give it up. Perhaps the kind of fuel had something to do with it. I used old cotton and burlap cloths that had been used over the brood-frames, and gnawed by the bees until worthless. I will say, just here, that there is reason to believe that propolis-coated rags or cloths are the very best materials for smoker fuel to be had. They will last longer than any thing else I have tried. The smoke will not stain the whitest section, as I have found clear wood smoke will do. It has a pleasant odor, and is less offensive than any other smoke; and, more important still, this smoke will quiet the bees quicker and more perfectly than any I have heretofore used. But to use such old rags to the best advantage requires a smoker with a strong blast; for, as soon as the propolis warms and softens, the rags are apt to settle together and prevent the air from passing through the smoker.

From what I have written, it may seem as though I were somewhat enthusiastic over the good qualities of *my smoker;* but I have little fear but that any other bee-keeper who has many colonies of bees to handle, who may give it a fair trial, will be equally enthusiastic in its praise. J. E. CRANE.

Middlebury, Vt., Oct. 22.

[When the Crane smoker was first illustrated and described in the *Bee-keepers' Review*, we were prejudiced against it, because, up to that time, all arrangements in bee-smokers for preventing smoke from going into the bellows by means of a valve connected to a continuous flue to the fire-box, had proved to be complicated, and a failure. But as Mr. Hutchinson spoke highly of it we were open to conviction, and soon after wrote to Mr. Crane, asking him to send on one of his smokers, which he did. We were delighted with it at once; and *then* we saw that it was difficult to understand the real principle without seeing the implement itself. But we trust that the painstaking care we have given to the new engravings will enable our readers to catch the idea. Perhaps we should add that the little valve F G, Fig. 1, just the moment the bellows is compressed, lifts up to the position shown by the dotted lines, making a continuous canal or flue to the smoker-cup; and as long as pressure is exerted upon the bellows, the air can shoot on uninterruptedly into the opening N, Fig. 2; but just the *instant* it is released, and long before the suction of air backward can take place, the little valve F drops back, in obedience to a little spring, effectually preventing any return of air or smoke into the bellows. It is impossible for smoke to come in contact with the valve, and hence it will remain clean. In the month or so we have used it, the valves have been perfectly clear of creosote accumulations. The grate is omitted, but is fastened into a swedge just before D, Fig. 1.

In our opinion, there is no smoker that has ever been produced that will yield the volume of smoke that this will; and for blast it is fully equal to the Clark. The only trouble we see with it is, that the shut-off-valve device must be made mechanically perfect; and while ours have worked for us a month very nicely, it is possible that, in a year or so of time it might give trouble.*

BASSWOOD AND ITS PROPAGATION.

WHY IS IT IMPRACTICABLE TO GROW IT FROM SEED?

Why doesn't basswood seed germinate, and produce plants? I am induced by J. A. Green's question, on page 770, to ask this question, as, in all my observation, covering a period of several years, I have never been able to find a single seedling, even under old trees, where the ground was covered with seed. We are told that stock feed upon the young plants, and it is very likely true, as most of the old trees here are found growing upon steep bluffs and places where stock can not go. Experiments with seed mixed with sand in boxes, kept over winter, both in cellar and exposed to freezing, have resulted in failure. Now is the time of year that seed is ripe, if it ever is; and I would ask those who have succeeded in making it grow, to tell us how to keep the seed over winter, and how to handle it to have it grow. It is one of the greatest drawbacks that we have in the planting of this valuable honey-tree, that the trees are hard to get in any quantity of suitable size for rapid planting. I see you have taken them out of your late catalogues. From the disposition of the tree to sprout from the roots, one would suppose it might be propagated from small root-cuttings, like the blackberry; but, again, we find all sprouts attached to the main stump, and none growing from buds or eyes upon the small roots. L. C. CLARK.

Granada, Kan., Oct. 22.

[Friend C., basswood seed does germinate and produce plants, providing you learn how to make it do so. In the first place, the seed must be gathered and sown as soon as it is fully matured—usually in September or October. A coating of wood dirt or forest leaves over the seed seems to be beneficial. Sometimes perhaps 75 per cent of the seed will grow, but usually not more than half, and sometimes only 25 and even 10 per cent. If you can find a piece of basswood forest where no stock is permitted to pasture on it at all, you can usually find plenty of young basswoods. We have taken from our price list only the small-sized basswoods. The reason is, we sold out and did not succeed in getting young trees so we could get them at our former prices. It can be propagated by cuttings; but sowing the seed is usually the cheapest and best way. The subject of raising the cuttings, and also planting and sowing the seed, has been fully written up in some of our back numbers—perhaps a dozen years ago.]

A. I. R.

THE INDIAN ORPHANAGE OF INDIAN TERRITORY.

WHAT IT IS, AND ITS WORK.

Friend Root:—Knowing that you and many of your readers are interested in missions as well as in bees, I thought I would write a little in regard to my trip to the Cherokee Nation, Indian Territory. I had two objects in view in coming here. One was, to look up the Territory as to its probable value as a bee country; and the other, to visit and inspect the Gospel Mission and Indian Orphanage, conducted by my friend J. E. Wolfe and his good wife, who is an educated Cherokee lady. The orphanage farm and wood-working shop are situated five miles west of Vinita, I. T., in a most beautiful plain, surrounded by gently rolling hills and narrow strips of timber skirting the numerous small streams. I find the orphanage the nucleus of what may some day result in great good to this whole Territory. They have a shop 40 x 60 feet in size, devoted mostly to the manufacture of chairs. Since coming here I have made some Langstroth hives, and left them a full set of patterns, so that, in the future, they can keep bees along with their other branches of farming, which comprises all kinds of crops and gardening suitable to this locality of short mild winters and long pleasant summers.

This is a non-sectarian mission, and the children are taught simply Bible Christianity; and the aim is, to give them a fair education and fit them for a useful life. The children are industrious, happy, and bright, and live and work together as harmoniously as any family of sisters and brothers.

Later. Since the above was written, the smoker got a little wet; the wood swelled, and stopped the valve. This part of the smoker might be made of metal; but this would make it quite expensive.

As regards bee-keeping, there is a great abundance of fall flowers, especially goldenrod, which seems to cover the prairies; but as they have no white clover, basswood, nor alfalfa, I do not think it would pay to keep many bees in a place, therefore it is not a country for bee-keepers; but for gardening, stock-raising, and fruit-growing, I think it is fine, and in time it may become a fair bee-country.

If there is any one who has boys' and girls' clothing, or a dollar to spare for a worthy Christian work, I would say both are much needed here now. They take in, feed, and educate the little destitute Indian orphan boys and girls, in order to make Christian men and women of them. It is a great undertaking, as there is so much expense connected with getting the necessary buildings up and the farm opened. All this has been undertaken on the plan pursued by George Müller, of Bristol, England; but in time it may be made self-supporting to a great extent, as they have 1500 acres of fine land on which are water, wood, good building-stone, and a coal-bed. With all these natural advantages, and a fine climate, where is there a better place to establish such an institution?

Vinita, I. T., Oct. 21. H. LATHROP.

RAISING LETTUCE IN WINTER.

BY E. C. GREEN, OF THE OHIO EXPERIMENT STATION.

Friend Root:—In reading your book, "What to Do and How to be Happy While Doing It," I find there is a great deal said about growing lettuce in the winter; and while the rules laid down in that book were not followed, and, in fact, I had never read them carefully, yet the plan or way of raising lettuce given there, especially the one by Mr. Davis, is so similar to what we have hit on that it seems to me they might be called the common sense of lettuce-raising. There is no great secret about the matter—not much more than there is in raising a crop of corn, if the conditions are right; but there is the trouble. If you have flues that smoke, and glass that lets in but half of the light, and such drawbacks, you will not be able to raise a good crop of lettuce any more than you would a good crop of corn on poor worn-out land, with no manure to put on it, and bad weather to contend with.

We started this winter with a house that was almost as light as outdoors, the glass being 16x24 inches. We heated with hot water, so there was no smoke, dust, nor fumes of any kind to injure the young plants, and the soil was as good as we knew how to make it; and, as Mr. Davis says, "the better care and attention given the crop, the better success you will have." To illustrate what care and careful attention will do, I will say that, during the first part of the winter, by close watching we succeeded in keeping our greenhouse almost free from that pest known as plant-lice, by the use of tobacco dust; but as we grew more lettuce, and had more work to do, our vigilance relaxed somewhat, and the little plant-sucker multiplied until now we are well supplied with them. But now they are attacked by a disease that bids fair to exterminate them, the disease being a fungus which is similar to the one we often see on house-flies, and called by scientific men *Empusa muscæ*. They have not been so bad as to show any effects on the crop, however.

Starting in with favorable circumstances, and being able to control the plant-lice, we have been able to grow a large amount of lettuce, which brought fair prices, and to carry on a number of interesting experiments. Our first was on the different distances apart in setting the plants in the bed. Our conclusions were, that six inches was the best, all things considered; less than that crowds the plants; and more puts too few plants on a given space to be profitable.

Our fertilizer experiment was not very satisfactory. We made several tests with the nitrate of soda; but in no instance could we see any good done by it. I have seen results from other stations where it has been used, and it does not seem to increase the crop, but makes the plants rot worse. I should have liked to try guano, but it was not included in the fertilizers that we tried.

Our experiment with sub-irrigation was one of the most interesting that we have tried, and it showed the most decided results; but we have not come to any definite conclusion on the subject, for it has not been tried in enough different ways to speak with certainty; but I believe, from what I have seen, that this method of watering, combined with a good mulch on top of the bed, will do more to help keep the rot in check than any other way. The rot, or lettuce mildew, has been one of our serious troubles in the work, and there seems to be complaint from other sources. I was in one house this winter that had nearly ten thousand plants in it that were nearly ruined by the rot. I hope something can be found that will prevent it in a measure. E. C. GREEN.

Columbus, O.

[The communication above was sent us over a year ago; but by some blunder it did not get into the journal. Prof. W. J. Green, brother of the writer of the above, visited us a few days ago, and he said this matter of sub-irrigation was giving some most encouraging results with other crops than lettuce, both in the greenhouse and in the open air.]

IRRIGATION—RAISING WATER FOR BY ENGINES, WINDMILLS, WATER-WHEELS, &C.

SOMETHING TO THE POINT, FROM ONE OF OUR FRIENDS IN THE IRRIGATING REGION.

Friend Root:—Your correspondent who wishes to know something about power to raise water 24 feet to irrigate a two-acre garden should not invest in a wheel. It would take an immense wheel to lift the water so high, and the expense with a wheel is sometimes quite heavy. Of course, this depends somewhat on the character of the stream and the floods that may occur. Our first settlers, acting independently of each other, used wheels; but now that there is coöperation in securing a water supply, wheels are seldom used.

There is no patent on the old-style wheels; but a new one, to rise and fall with the stage of water, has been patented. What its real merits are I can not say. Looking at the question from this distance I think your correspondent would best use a windmill. Perhaps instead of a tank he has a good location for a small reservoir. In this case a reservoir might be preferable.

It would be difficult to make celery ground too wet. The ground could be kept constantly wet from the windmill while running, without danger from following rains. If the windmill should stop running, the crops would not suffer for ten days or two weeks, even if there is no rain.

If the "new celery culture" is followed (that of close planting so that the plants do not need banking), a great deal of water will be required;

however, the amount of land to be irrigated is too small to justify much expense, even though very close cropping be followed. In many cases our people use a steam pump for lifting water, with entire satisfaction; but this is too expensive for a two-acre garden, unless the pump could be used for other purposes as well.

There are many things to be taken into account in irrigating besides securing a supply of water. Where the supply is short, the saving of water is a study in itself. The advantages of irrigation should not be conceded to the arid region alone. Irrigation is essential to complete success in high-pressure gardening in almost any country. E. BRAYTON.

Pueblo, Colo.

LADIES' CONVERSAZIONE.

THE CONSER PLAN OF NON-SWARMING.

MRS. AXTELL EXPLAINS WHAT IT IS.

I believe that the Conser plan of non-swarming will pay much better than taking away the queen. We never could succeed in getting the bees to work so well for comb honey (and that is the kind of honey we take, except a very little extracted each year to supply the few calls we have for it) as when they have a vigorous laying queen in the hive. The more vigorous the queen, the greater the quantity of honey gathered from that hive. I fully agree with Mr. Conser when he says, "No, indeed; the queen should be kept at all times at home when the bees are so busy" as they are in swarming time.

The Conser plan of non-swarming is, to arrange a hatching-box in the center of three hives, one on either side and one at the back of the box, connecting the box with each hive by a $\frac{11}{16}$-inch tube between the hive and box about the center of the brood-comb. In the center of the tube is a queen-excluding piece of zinc to keep the queen from going into the hatching-box. The box is divided into three apartments—one apartment for each hive. There being three together, there are bees and brood enough to keep each other warm at that time of the year. Each apartment is covered with a piece of heavy ducking that keeps two covered while the third one is being manipulated, and over all is a board cover like other hives. Each little apartment has its own entrance from the outside. The hives should be put into groups of three before swarming time comes, by moving them a few inches, or a foot, each day, or by placing them in that position when brought from the cellar; but all should be good colonies, and the queen laying in the outside combs.

Eight or ten days before the honey season opens from white clover, stock the hatching-box from brood from the hives thus: Open one of the hives and hunt out the queen, and lift out the comb that she is on, and hang it on the comb-rack, or lean it against the hive until ready to place back. Take out two combs filled with capped brood (not unsealed, but capped brood) and place them with the adhering bees in the apartment of the hatching-box that is connected with the hive, first closing up the entrance of the tube that leads back into their own hive. Leave the tubes closed for 48 hours; leave the outside entrance open—at least, we did; but he did not, in his directions to us, say whether it should be left open or shut.

The comb the queen was on should be returned to her hive with an empty comb placed on each side of the comb she was on. Treat the two other hives in the same way as the one described. In eight or ten days the same treatment should be gone over again, this time using the two combs in the hatching-box, and one empty one, returning them to the parent hive and placing one on each side of the comb the queen is on, as before, and taking out three combs of capped brood and placing them in the hatching-box as before; but the tube need not be closed this time, as there will now be bees enough that have learned to stay in the hatching-box to care for the brood. I should think it would not be out of place to brush off part of the bees when taken out of the hatching-box, but he did not direct us so to do, and we did not.

At this second manipulation place the surplus cases on the hives, as the hives are now very full of bees, and will immediately start to work in sections if bait combs are given them. In about a week or eight days, go over the treatment again, and put a second surplus case on under the first. If the surplus cases were small they may need three by this time if honey is coming in. From two of the hives thus treated we got a few more pounds of honey than from any other hives in the apiary. In the other colony the queen failed, and I took it for granted she was dead, as I found queen-cells and saw no eggs or larvæ, so I gave them a queen, and at the next manipulation I found cells and the old queen, so I broke up that colony. The two colonies did not swarm. We applied somewhat the same principle to other colonies, that of giving the queen more room, none of which swarmed; but we found queen-cells in hives that I think had old queens; but by taking out one comb in the center once in six or seven days—the same comb each time—and destroying the cells we saw, there was no swarming from those hives. We did not look very carefully for cells. I think this year was not a very bad one for swarming. The honey came in slowly at first, and we gave plenty of room, so they did not get the swarming fever badly, as in other years.

The plan of giving an empty comb in the center frequently, and each time taking the same comb, as I have mentioned, and also mentioned in this journal, works well, gives nearly as good results as the Conser plan, as that comb can be used to build up nuclei, and the strength of the colony is kept up by the remaining combs, and the bees worked well in the sections. Our hive is not very well adapted to the Conser plan of manipulation, having the closed-end frames resting on the bottom-board, and hive clamped at the side; but any hanging frame that will admit of frames being taken out of the center, would, I think, work better. Working only three hives, after the Conser plan, hardly gives a fair trial. I think we shall want to try more another year before fully deciding, though I am satisfied that the queen needs more room rather than less than the usual size of brood-nest. True, it leaves a very large colony at the close of the honey harvest; but they will gather enough more honey to make up the difference, and will find and store honey longer than smaller colonies. I believe that such large colonies, if the brood-nest is left alone, will always, or nearly always, have enough to winter on, even if the fall harvest is short.

The Conser plan is patented, or a patent is applied for; but if it works as well as I think it will with the hanging frames, it will soon pay one who uses the hanging frame to use it, even if he does have to pay ten or fifteen dollars for a sample hive and a right to use it.

If the plan itself does not come into general use it may lead to something that will. Even if it does not prevent *all* swarms, it would prevent so many that swarming would be managed easily. True, in reading over the plan it looks as if it were considerable work to carry it out; but it is not so much as if the bees were left alone to swarm, and the work can be done at one's leisure, when not in a hurry in the heat of the day, with half a dozen swarms all needing to be cared for at once.

If a person has but a few colonies, and wishes to make the most of them, I think it will pay, or some similar plan, so that we can keep enormous colonies together, as they do so much better work in sections, and do not have to be constantly watched; and if a person has a great many colonies, and help is scarce, that, or a similar plan or plans, will pay to care for a part of the colonies, that the colonies that are not thus treated may be more easily cared for, and thus make swarming more easy for the apiarist. But with all the plans that are followed, we must or ought to have one of the B. Taylor, or a similar device, to catch the swarms if they come faster than we can easily care for them. I feel quite in favor, also, of taking out a comb of brood from the center of a few colonies every few days from the colonies that are the most difficult to watch, and the most likely to lose swarms from. I don't think it necessary to put an empty comb in each time. If the lower half is empty after the second time of changing, I think it would answer. Such care of colonies can be taken in the cool of the evening or morning, and at one's leisure.

IN BEE CULTURE.

Let him who wishes to XL.
Or who aspires to B most Y's,
Remember this: A Y's man O's
Much of his wisdom to his I's.

And he must not his ears XQ's;
But ears must hear and I's must C,
And he must all his senses U's
Who hopes a Y's man e'er to B.

MRS. L. C. AXTELL.

Roseville, Ill., Nov. 1, 1892.

[The Conser plan of non-swarming, if we understand it correctly, is simply a scheme for the getting of populous colonies in small hives; and the presence of but little brood in the hives at a time, we suppose, takes away the desire for swarming. We question, however, whether the plan will work even generally; and even if it does do so, the labor and machinery involved would be more than the caring for the swarms in the ordinary way. Just think of hitching the hives nearer together every few days to get them in a triangle, equally distant, and, after that, shifting brood-combs every ten or sixteen days into the hatching-box! Besides all this there is the expense of the connecting-tubes, and holes in the sides of the hives. Even if the plan should secure more honey, the cost per pound would be much more than by the old way. If our surmises are incorrect, we should be glad to be set right.]

FUN.

SENSIBLE SUGGESTIONS FROM MISS ANNA B. QUILLIN.

"Oh! I just *love* to do things to shock people—it is such *fun!* and if I don't do something to wake up this town before I leave it, I miss my guess."

So said a gay young girl of seventeen, bright, attractive, and full of life; a petted, only daughter, and an heiress in her own right, she held what would be considered by many an enviable position in the world.

"Why, Marta Belgrave! you don't mean to say you are going to engage in any new mischief?" said one young girl of the group, with very evident surprise, both in tone and manner.

"And why not?" was the reply of Marta, accompanied by a saucy toss of her head. "I do think this is the most 'dead and alive' old place—one never can have any fun here. Well, I am not going to 'give myself away,' but in a week or two I am going to have two of the jolliest girls you ever saw, to pay me a visit; and then, look out! if we don't shake up this old town, I'll be surprised."

"Well! I should think you had had enough of that sort of thing, Marta," was the reply.

"Oh, I am going to have some fun, and I don't care what people think of it. I am going away, and will be gone all winter, so it will not make any difference to me what they say about me, for I'll not be here to know it."

A number of girls out shopping had met; and as they paused for a few moments near the door of a store, this fragment of their conversation was overheard; and I wondered how many of our girls think as did Marta. Dear girls, do any of you think that it doesn't make any difference what people think or say of you? Marta has gained the unenviable reputation of being "rather wild," and "quite fast." Have you ever thought it didn't make any difference if people considered you in that light, and applied those terms to you? Do you think it doesn't make any difference if you engage in questionable "fun,"—flirt or correspond with strangers; play practical jokes; and do various mischievous things that may injure or annoy others? My dear girls, one little thoughtless act, which you may designate as "only fun," may so smirch your character that years of right living will not efface the stain. It may seem fun at the time; but, oh the bitter, bitter fruit it may yield to be eaten in the years that follow!

There is much to enjoy in life—many innocent pleasures, and it is right to enjoy them and have "good times;" but when there is any questionable fun on hand, count well the cost, and be not persuaded to enter into it, else the time may come—yes, it is almost certain to come—when regret will be your guest. As a certain poet has expressed it,

"the heart bleeds,
And pale regret comes weltering in tears."

Esau sold his birthright for a mess of pottage. Dear girls, do not run the risk of losing your good name for what is falsely termed *fun.* Do not be too familiar with boys or men, nor allow them to be so with you. Shun any one who would tempt you to do any thing your parents would not approve. And when friends give advice, and warn you of the pitfalls that may beset your pathway, take it kindly. Perhaps they may not express themselves in the kindest and best manner, but you should understand that they speak because they have your best interest at heart, and you should take it in the spirit in which it is intended. Do not think they are trying to cheat you out of any wholesome pleasures when they are only trying to save you from sorrow and suffering.

Have respect for the opinions of good people; and to gain their respect, and to deserve it, is no light matter—not a matter to be treated with indifference, but as something to be prized. Take this thought with you, and remember it always: A good name, a pure character, is the *most precious earthly possession* any one can have. Therefore, dear girls, guard yours well.

ANNA B. QUILLIN.

Ipava, Ill., October, 1892.

ROSES.

DR. MILLER TELLS WHAT HE KNOWS ABOUT THEM; THEIR PROPAGATION, ETC.

In a foot-note on page 774 I am "respectfully called upon to answer" some questions about roses. Mr. Editor, do you realize what a dangerous thing it would be to turn me loose on the pages of GLEANINGS with such a topic as "Roses"? Why! it's part of my creed, that God made the beautiful things of the world for us to enjoy; and I believe that, if the boys and girls of our homes were more generally encouraged to cultivate a taste for flowers, there would be less danger of their going astray in their search for pleasures.

Passionately fond of flowers, of late years my attention has been confined almost exclusively to roses. No other flower has so many admirers, and it is likely that, through all time, the rose will continue to be queen. How I wish, friend Root, you could be here when the roses are at their best! I am very sure you would become enthusiastic. Why! there hasn't been a day since roses began to bloom, with no bud to be seen. Shortly after the middle of May, Count d'Espresmenil offers its first opening buds with its brilliant green foliage; then another and another of the beauties opens out, varying from pure white through all the shades of pink and red to almost black, and, again, from the lightest tint to a substantial yellow; and when winter finally freezes up the bushes solid, it will be with here and there a bud or flower. Just now I have been out and counted some sixty buds in various stages of development. Some of these will open out; but as it is now the very last of October, some of them will never get to be more than buds, for in this cool weather they develop very slowly.

To answer Mrs. Fisher's question, grafting is very little used in this country in propagating roses. Budding is somewhat used, and layering occasionally, but the great majority of roses are raised from cuttings. Besides these four ways of increasing roses, there is a fifth, and it is the way mine are usually increased—that is, by buying. Except a few kinds that can not easily be raised from cuttings, you can buy small roses and have them sent by mail for about a dime each. Larger plants can be had for an increased price.

For outdoor culture you can have almost any kind of roses; but if you live in the North, the perpetuals, or hybrid remontants, are the ones to get for a number of years' growth. Let me caution you, however, that perpetuals are not perpetual in their blooming. They will give you a full crop in June, and an occasional bloom or set of blooms afterward. Roses don't bloom nearly as well on bushes as they do in catalogues.

But I'll tell you a trick worth knowing. As soon as the buds are big enough to be seen on my remontants, I carefully pick them all off by pinching with thumb and finger nails, and I try to keep them all picked off till about the time the common June or annual roses are done blooming. In spite of my vigilance, some of them will escape notice till they are so large that I have not the heart to pick them off, so that quite a showing will be left, giving me no trouble to cut two bushels on a Sunday when they are at their best, and from that to one or two vases throughout the season, to decorate the church. You see, if you allow them to bloom at their own sweet will they will exhaust their strength, giving you a mass of bloom when everybody has roses; but if you don't let them bloom when they want to, they'll keep at it afterward.

But it will not do pick off the buds of an annual bloomer, for they will not bloom out of their season. Moss roses (and nearly all mosses are annual) I cut back savagely in spring, cutting back half or two-thirds of the bush, and they give finer blooms, besides making them later. Mosses are among the very hardiest.

None of the hybrid remontants (please remember that "remontant" is the right name for what are quite commonly called "perpetuals") have any shade of yellow, and I doubt whether there ever will be a yellow remontant. If you want yellow roses outside of the June roses, you must have teas. Although the teas are more tender than the remontants, they are more abundant bloomers, and for house culture away ahead.

Let me tell you the secret of success with house roses, at least at our house. It is, simply to wash the plants at least once a week with soapsuds. Hold the plant over a dish-pan of hot soapsuds, and drench it thoroughly. Then dissolve hen manure (other will do) in water, and pour some of the liquid part on the soil in the pot every week or so.

You may enjoy rooting some cuttings. In February, March, or April, take a cutting two or three inches long, having on the end of it a bud half blown or more; cut off the bud, stick the cutting in the ground, and cover a tumbler over it.

There, I suppose that's all the room roses ought to have in GLEANINGS, and I haven't said half I wanted to. C. C. MILLER.

Marengo, Ill., Oct. 31.

A BEGINNER'S EXPERIENCE WITH ROBBING.

SOME OF HASTY'S EARLY EXPERIENCE.

For some time back E. E. Hasty has been writing an interesting series of articles in the *Bee-keepers' Review*, entitled "Comments on a Beginner's Day-Book." In the last article there is one paragraph that is so interesting and so well told that we place it before our readers. The first sentence, in fine print, is an extract, written years ago, from the day-book, following which is his comments:

"October 5th. Contracted the entrance to stop robbing."

The apiary previously to any purchase had been almost totally neglected for some time. Where swarming prevails as it does here, a percentage of the colonies in the yard will turn up queenless late in the season, get weak, infested with fertile workers, and, very likely, infested with larval bee-moths also. A carnival of robbing out these new colonies had been held in my brother's apiary, and he was too busy farming to interfere. I interfered on one occasion, I remember. A colony not far from my window, at which I heard a rumpus every morning before I was up, I shut up tight. I knew it was not good for bees to be shut up; but I pitied this colony so—attacked at untimely hours so many days in succession and holding out against it notwithstanding the disadvantage of having no regular bottom-board, that I fixed things and shut them in—surely be destroyed if I didn't, you know. Well, it turned out that they were not being robbed at all. They were simply a particularly enterprising nation of robbers; and the hot weather, with the additional heat which they made by trying to get out, melted the whole establishment down and drowned the pirates in their own stolen honey — a tolerably fair greenhorn's caper. After that you can imagine I let things alone; and robbing reached such a pitch that a good colony would be attacked and the ground covered with dead before the assailants would haul off. This seemed to be very shocking at the time; but at present I do not regard it in exactly the same light. The bees that got killed trying to rob in the fall are not young enough to last for next spring work, I reckon. It is better that they clean out every thing that can not make a royal fight, than that all these odds and ends of unseaworthy colonies should try the stormy Atlantic of a hard winter just as they are without keeper's care or comrade's cribbage. But of course I was just right in promptly putting each surviving colony in shape to defend itself. And Apiarius had better be the robber when robbing needs to be done.

THOSE IMPORTED QUEENS IN QUARANTINE.

W. C. FRAZIER'S EXPERIENCE.

"Quarantined" was one of the first things I saw in GLEANINGS of Oct. 15th. I had meant to write you that I had found a quarantine not especially conducive to the safe arrival of queens, but had neglected it. I received my September importation. It was detained in quarantine about 15 days. There was one queen more than half of them that came through alive. There was quite a number of orders awaiting them, which I filled on arrival. After all orders were filled I had four queens left, therefore I was obliged to discontinue the sale of them. These queens cost me about $2.00 more than I got for them; however, that cuts no figure, as such things have happened before.

There will be considerable hunting to find some one on whom to put the blame for killing the queens. Certain it is, the party in Italy who sent them is not to blame. That importing will be rather risky the coming season, I do not doubt; however, we can all go to breeding the golden bees and make our fortune.

My imported queens and their daughters are now quiet, clustered, and have ceased rearing brood. I have about five goldens. They have from two to three combs of brood. Whether this is a good thing at this season, I leave for practical bee-keepers to judge. It would not do for *me* to say. I am prejudiced; I am interested in other bees; I import a few dozen each year from Italy. But, seriously, I have had them for three years, most of the time. The time I did not have them was in the early spring, and they always all died in winter, except in the season of 1890–'91. I have never yet taken a pound of honey from them, and have nearly always had to feed them. I may be out of luck. May be I get my queens of the wrong breeder; but I have bought of several, and the result has been the same. In the South these bees may do very well; but they don't seem to do here.

Why can we not have a trial of these bees and the daughters of imported queens at some of our experiment stations, or by some of our large honey-producers, or both? There would be no use in having any thing but a friendly contest—no use betting, or donating any thing except the queens. If they are better honey-gatherers, or will make more points by the scale as adopted by the North American Association, then I wish to purchase queens of that strain. If the daughters of imported queens score more, then there can be found breeders who have them to sell.

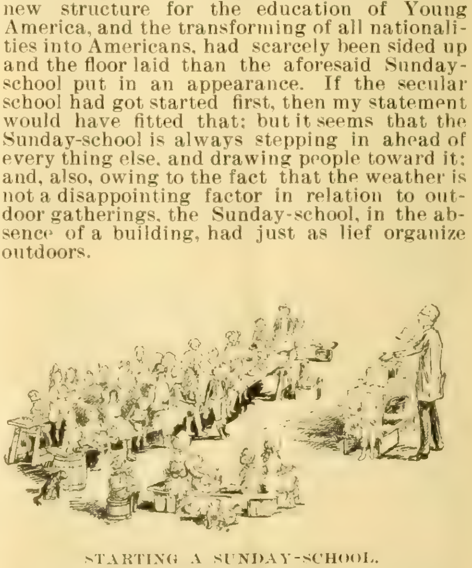
Atlantic, Ia., Oct. 22, 1892. W. C. FRAZIER.

[We should be very glad to see the imported Italians compared critically with our home-bred strains. We have so far found the imported to be the most uniform in markings and general characteristics. With us they are the gentlest; and while, perhaps, not the best honey-workers, they are the peers of any home stock. Some may disagree with us; but it should be remembered that we have opportunities for comparison equaled by no others.]

RAMBLE 72.

HOW SUNDAY-SCHOOLS ARE A DETRIMENT TO HONEY-PRODUCTION.

The above statement may sound somewhat strange; and, though made by the Rambler, who has always been in favor of and has sustained the good moral work of the Sunday-schools, it does not follow that he is opposed to Sunday-schools. On the contrary he hopes that this ramble will strengthen certain people to help along the moral forces. The fact, however, remains that both the secular schools and the Sunday-school have a potent influence in the above direction. Two miles northeast, and directly in front of the apiary managed by the Rambler, is the embryo town of Bloomington, on the S. P. R. R. When I first went out to the apiary, nearly a year ago, there were only a few scattering houses, or, I should say, cabins, in the brush. Irrigation has been extended to the place, and other houses begin to dot the plain. As soon as there were a few children seen playing around the cabin doors, the parents, in most cases, being good eastern people, bethought themselves of organizing schools; and though the children, all told, numbered less than 40, a schoolhouse 18x30—yes, 18x30 is what an eastern community would build for the accommodation of a much larger number of children—but here people seem to have larger ideas, and even the small towns have splendid school-buildings; and Bloomington, not to be outdone by her neighbors, built, not an 18x30, but a $3000 schoolhouse, two stories in height, several large rooms, a tower, a bell, flag-pole, and "old glory" proudly waving above. This new structure for the education of Young America, and the transforming of all nationalities into Americans, had scarcely been sided up and the floor laid than the aforesaid Sunday-school put in an appearance. If the secular school had got started first, then my statement would have fitted that; but it seems that the Sunday-school is always stepping in ahead of every thing else, and drawing people toward it; and, also, owing to the fact that the weather is not a disappointing factor in relation to outdoor gatherings, the Sunday-school, in the absence of a building, had just as lief organize outdoors.



STARTING A SUNDAY-SCHOOL.

In my Sunday-school experience in the East I have heard some well-meaning but purse-worshiping people advertise their disbelief in missionary work, and many a Sunday-school superintendent has raised a meager sum once a year to send to the home mission to aid in the establishment of Sunday-schools in the far West. Having witnessed the raising of funds on one side of the continent, it was with genuine pleasure that I witnessed the planting of the seed in this far western land. It happened in this way:

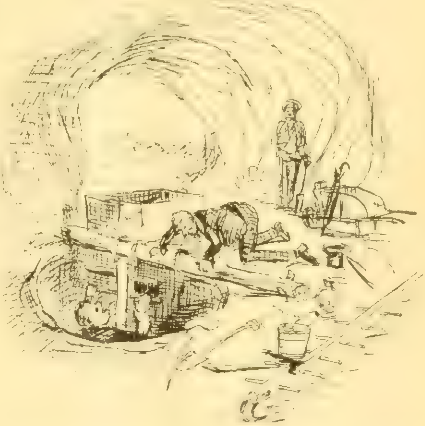
The new settlers desired a Sunday-school, and an agent of the home mission happened along. These missionaries are always handy. They can see what is going to be a new town a long way off, and are ready to put up with any inconvenience if they can only organize a Sunday-school. In this case the seats were boards mounted on saw-horses or nail-kegs, and the preacher's desk was a few boxes piled up. The legs of the urchins dangled from the seats that were too high for them, and some were so short that they didn't dangle at all, but their toes stuck straight up just over the edge of the board, while they seemed to take great interest in the proceedings. After the Sunday-school was organized the agent electrified the audience by stating that the Land and Water Co. had offered ten acres of land, selling price $100 per acre, and two building lots, to the first denomination who would build a church; and as his denomination was well represented in the settlement, there would be a church ready for occupancy before Christmas.

That's the go-ahead and hopeful way they do business in this country; and the teaching I wish to convey is, that money devoted to the home missionary work was well invested in this case, as I have no doubt it is in a great majority of cases; and the schools like this one became at once self-supporting. So, my friend, whatever your opinion may be in missionary work in general, do not fail to give liberal aid to the home mission of your respective denominations. It will aid to plant the standard of good morals in many an embryo town.

The next point is the cutting off of honey resources. In a previous ramble it was stated that the apiaries around this valley had, during the past poor season, produced many tons of honey. It was drawn mostly from the valley, which is well covered with all kinds of wild bushes, including sage, wild buckwheat, and honey-plants too numerous to mention. The establishment of Sunday-schools means the rapid digging up of honey-plants, and their places will be filled with cultivated fields. Of course, it is a pleasure to see the wild covering of the plain rolled up like a scroll, and see the reclaimed lands dotted with thrifty homes. The rapidity with which it is being done is shown by the fact that two large colonies of thrifty and steady Dunkards have taken up about 1200 acres of these lands, and will soon commence digging and improving, and probably the first thing will be the establishment of a Sunday-school, after their peculiar belief. A decline in honey production will follow, and it is hardly possible that fruit and alfalfa culture will ever take the place of the more prolific sage in the secretion of honey. Next in order will come the conflict between the fruit-men and the bees in the foot-hills; and I can safely say that the Sunday-school is not in this fight; for the man that poisons and burns bees is usually if not altogether outside of Sunday-school influence.

BEES AND FRUIT—THE REAL SITUATION.

Upon this point of the abuse of the rights of bee-keepers I have an array of facts that will harrow up the sympathetic feelings of every bee-keeper in the land. As a prelude to future articles, I wish to give a brief account of a visit to Glendale and the home of Mr. Woodbury. While in Los Angeles in September, and while having a friendly chat with Mr. Brodbeck, who should run against us but our old friend and veteran bee-keeper Mr. Corey, of Santa Paula! Having a few hours to be profitably spent, Mr. B. advised us to run out to Glendale and interrupt the even tenor of Mr. Woodbury's ways; and about 10 A. M. found us safely on the ground; but instead of finding Mr. W. walking around in a civilized way, we found him under ground—or, in other words, in that tunnel previously mentioned in GLEANINGS. The tunnel had progressed inward, and then downward, like a well; and down there in the water was Mr. Woodbury. Peering up he remarked, "Well, what can I do for you?" But before I could tell him I wanted a job at tunneling, Mr. Corey thrust his head over the opening. It was recognized, and, "Oh, ho! that's you!" came from the well; and when Mr. C. said the other head was the Rambler's, there was another exclamation, "Ah, ha!" and a great kicking and splashing of water followed as he swung himself up to his ladder, which was secured at the top, and lacked several feet of reaching the bottom.



HOW MR. WOODBURY GETS OUT OF HIS TUNNEL.

When upon the surface we found Mr. W. a very pleasant bee-man, and, of course, the apiary of about 90 colonies neatly arranged on terraces was looked at and discussed. Mr. W. is not only enthusiastic in bee-management, but also in fruit culture, and has a good showing of figs, oranges, and small fruits. The raspberries were bearing a second crop, and we picked several fine clusters; and although Mr. W. cultivates raspberries on his ranch, without injury from the bees, a neighbor was irritating him because the bees were destroying *his* raspberries, and was threatening all sorts of vengeance against them. Mr. W.'s bees were the only ones in sight, and, of course, came in for their share of all of the blame. The reason why Mr. W.'s raspberries were uninjured in the immediate vicinity of the bees was from the fact that the berries were picked before they became overripe, while the neighbor allowed his berries to get beyond that period, and were really worthless for shipping. Still, Mr. W. offered to pay damages, and was really thinking of selling his bees, which were a source of considerable revenue to him. Mr. Corey and I strongly advised him to stand by his rights of priority, for he had been on his ranch several years, and was among the first settlers. We also advised him to join the Union and let his neighbor run against something that might astonish him.

When we came away we felt as though we had cheered up our friend, and we hope he will remain cheered up.

When we departed we called upon a fruit-drying concern; and from the foreman, who is also interested in bees, we learned that, in drying peaches or any other fruit that is fumigated with sulphur, the bees seldom if ever touch it, while the yellow wasps will continue their depredations. Our foreman threw in the remark, that many fruit-men didn't know the difference between wasps and bees, and were always ready to curse them all under one head, and put all the blame on the apiary that might be in sight.

We stopped at the fruit-drying camp for dinner; and after seeing the chief cook scour the knives and forks by jabbing them down into the ground a few times, we returned to Los Angeles, feeling well repaid for our journey, or, at least, that feeling was enjoyed by the

RAMBLER.

THE WHEEL OF 1892.

WHAT ITS PROBABLE EFFECT WILL BE, PHYSICALLY, FINANCIALLY, AND MORALLY.

Lest some of the friends may complain that I am taking up too much space for the wheel business, I wish to say that we have added eight extra pages to this issue, in order to make up for this long article that seems to me should come in right here, if we expect to keep up fully with the times.

In taking up this matter, as I feel moved to take it up, the first thing that confronts me is the fact that a great part of our people have but little money to spend for wheels or any thing else in that line. Bee-keepers, as a rule, have had another poor season, and farmers generally, as well as market-gardeners, have had a rather hard time. In consequence of unfavorable weather, the crops have been poor and labor has been high. There seems to be a little discrepancy here; and, by the way, do not these "calamity" people lose sight of this very discrepancy? If one of the farmer's troubles is, that labor is so high that he can not afford to hire men, then surely the laborers must be the gainers if he is the loser. These men, therefore, who work for high wages are the ones who can afford to buy the wheels; and I believe it is the class generally who work for wages who are the owners of wheels. Notwithstanding this, however, a great amount of money is being invested in wheels. As I write, the wheel of 1892 is a craze. Perhaps I should apologize for using the word "wheel" instead of saying "Safety bicycle;" but I feel satisfied that any word that is on the tongue of so many people so constantly should be a short one. Most of you remember when we used to say "telegraphic dispatch." Go-ahead Young America, however, could not tolerate two such long clumsy words, and pretty soon "telegram" came of itself. No one stopped to inquire whether it was in the dictionary or not. By and by, even "telegram" was too long and hard to remember, and now, at least in business circles, the plain simple term "wire" has taken its place. If a man is going rapidly on a moving train, he can call to his friend, "Wire me at my expense;" and there are lots of such contingencies in every busy man's life, where he has but a moment to make his wishes understood. A hired man is going in one direction to the field, and another is going in another direction. Before they are out of sight the boss wants to make suggestions and give orders to both of them; therefore we want plain simple words that everybody may understand. For this reason I say "wheel." A few days ago a traveling man, a stranger, left a pair of valuable gloves on our lunch counter. One of the waiters brought them to me just as his carriage was disappearing in the distance, drawn by a couple of smart ponies. I stood with the gloves in my hand, my mouth wide open, waiting to decide what to do. Somebody sang out, "Jump on your wheel!" Almost before the words were out of his mouth I was pushing on the pedals. I kept him in sight enough so I could see him turn the corner, then the team started rapidly down a decline. By this time I was just flying. I could not make him hear, so I outstripped his ponies, and ran in front of him while he was going down a pretty steep hill at a pretty good rate. He was a good deal surprised when I brought his team to a standstill, and I was too much out of breath to do any thing more than extend to him his gloves. Now, there are thousands of times in life when the wheel will help us out of such emergencies. It afforded me no little gratification, I assure you, to discover that I could, when circumstances make it necessary, "run faster than a horse;" and I sometimes tell the friends, after I have made a long trip, that I can not only run away from a horse, but that I can almost *eat* like one. If the latter expression is too slangy, you can skip that part of my talk.

So much by way of introduction. It illustrates, however, that the wheel is destined to be something *more* than a craze. The results secured by it are too substantial and important to be a craze and nothing more. Last week Mr. Calvert wanted to attend a church conference, nine miles distant. He did not wish to be out of the office any longer than necessary. He made the distance on his wheel in just 45 minutes, notwithstanding he weighs 174 lbs., and a sprained ankle has been troubling him for two years past, making it very difficult for him to walk even *half* a mile. In fact, physicians have been telling him for a few months back, that, if he keeps on his feet as he has been doing, he must submit to a painful surgical operation. Well, his sprain has improved since he began riding the wheel instead of going on foot. The philosophy of it seems to be in the fact that the weight of the body is supported on the wheels. The wheels have pneumatic tires, and the ball bearings have been so perfected that the wheels probably move with less friction than any thing the world ever knew of until within recent times. As a piece of mechanism this modern wheel is the achievement of the present age. You may say a horse and buggy will do at least pretty nearly as well; but it takes a good deal of time to hitch up a horse; and it is rather expensive to keep one so that you may have it ready at hand to be hitched up. While the wheel costs almost as much (that is, it does just now) as a moderate-priced horse and buggy, it requires no hitching up, no feed, and there can not very well be any cruelty to animals to attach to it, even if forgotten and neglected.

Probably one of the great results brought about by the wheel will be that one may live five or ten miles out of the city, and easily be on hand during business hours, and that, too, without any expense worth mentioning. Of course, we must have better roads than we find in country districts or country towns, if we expect to use the wheel in all kinds of weather. And this wheel business has already awakened our people to the fact that one of the greatest wastes of the present time is in permitting our roads to be in such shameful condition as they are during a great part of the year. Ordinary country roads, however, answer very well for the wheel when it is not muddy. I have myself made 45½ miles in a day, without any fatigue worth mentioning. Ernest, as you know, easily makes 60 or 75; and experts, under favorable circumstances, make not only 100 miles, but 200 and even more have been made in special cases. The wheel will enable us to save money in many ways. On page 676 I told you about my nice little field of buckwheat that did not get sown until July 30th. It was cut in just 60 days from the time of sowing. When the crop was very fairly cured, and ready to thrash, I noticed the barometer was falling rapidly, indicating a storm. It was Saturday afternoon. Four miles away, somebody told me, they were thrashing buckwheat that very day. By the aid of my wheel I was on the spot in twenty or thirty minutes. They told me that, if my load of buckwheat could be run up by the machine by two o'clock, they would thrash it for me and I could take it right back home. The buckwheat, grain, and straw, were driven into the tool-shed just before the rain commenced falling, and I secured at the rate of over 50 bushels of nice grain per acre. The next day after the rain, the ground was harrowed up with the cut-away harrow, and rye took the place of the buckwheat. Somebody has called this a fast age. Well, the wheel will help us to make it a fast age, and it will help us to secure our property speedily from storms and other vicissitudes.

Outdoor riding and outdoor buggy-riding and horseback-riding have been recommended for ages for the health; and very much has been accomplished in this way. Outdoor air is unquestionably far ahead of any system of ventilation for rooms warmed by artificial heat; and horseback-riding has given much better results than buggy-riding because of the thorough shaking up and the exercise to a certain extent given to the rider. But horseback-riding is not for a moment to be compared to riding a wheel. To get the best results from outdoor air, the rider needs to take the *place* of the horse, and furnish the motive power. You may say that many patients are unable to stand such *violent* exercise. But it need not be violent. On a smooth level road it is much easier than walking—that is, if you ride slowly. Of course, there is a constant temptation to ride fast when you can do so; but for some strange reason that I can hardly explain, I have never yet heard of anybody who suffered because he rode too fast or too far. He may have been pretty well used up for the time being; but sleep, food, and drink, restore one so quickly that it seems almost too good to be true. I have been told there is only one disease for which the wheel is not to be advised, and that is heart disease.

And now a word in regard to the moral results that may be expected. The following, which we clip from the *Bicycling World* of Oct. 7, has been going the rounds:

> Says the *Christian Secretary*, of Hartford: "The great enemy of a proper observance of the Sabbath is not the saloon, great as that is: it is the bicycle. It is our opinion, that the bicycle causes more young men to neglect church and Sunday-school than almost any thing else."

I am very well aware that there *is* a great deal of Sunday riding. A young friend of mine rode 127 miles in one day, and that without feeling it, so he said; and then added, in a little lower tone, that *that* day was Sunday. I felt, of course, very sad to hear him say it, and I have felt sad to notice, through the *Bicycling World*, accounts of century clubs, or clubs who have made a hundred-mile ride in a day, and see the remark that so many of these rides were made on Sunday. It is a well-known fact, that livery stables do more business on Sunday than on any other day in the week. And I presume this is true north, south, east, and west. It is wrong, and it ought not to be; and their patrons, as a matter of course, are, very few of them, Christian people. Ministers do, perhaps, to some extent, patronize livery stables to reach their appointments; and in cases of sickness it is unquestionably right to go to a livery stable; for even the Master himself said, "It is lawful to do well on the Sabbath." A great part of the world will persist in regarding Sunday as a holiday; and to have a good time, they, of course, want to ride out into the country or attend the various gatherings or excursions that of late have been getting to be so much of a custom to be held on Sunday. Now, right here the wheel comes in. It takes the place, to a certain extent, of horse and buggy. If somebody is in pursuit of enjoyment simply, and his sole motive is to have a good time, without any regard to the Sunday question, he will, of course, learn to ride the wheel. He very soon discovers that, if he wants to have an enjoyable time, nothing else in this world can so add or contribute to the enjoyment as riding on the wheel. If there is to be a *dinner*, and you wish to enjoy it, just ride an hour or two before eating. The faster you ride, the more you will enjoy your dinner. If there is to be sight-seeing, or if you are going to visit a circle of friends or boon companions, nothing that has ever been discovered will make you so bright and good-natured as a good long ride on the wheel. Yes, we may go further: If a minister wants to preach a good sermon, or if a teacher wants to do justice to his classes, nothing else in the wide world will so wake him up and stimulate him to do his very level best, as this new sort of muscular exercise, to be taken in the open air. May be the *Christian Secretary* did not mean to compare the bicycle, in point of morals, with the saloon; and perhaps the editor had no thought of saying that the wheel bids fair to be as *demoralizing* in its tendency as the saloon; but, dear Christian friend, just think of that expression as it stands. The saloon no doubt calls men, old and young, from our churches; but, by the way, is it not a mighty step, a mighty *stride*, for instance, from church-going to saloon-going? It hardly seems as if such a step as that is made all at once. My experience teaches me that it comes more about in this way: The church-goer begins to find fault with the minister and his preaching; then he goes to picking at Christians, and claims they are not what they ought to be. Pretty soon he says he can stay at home and read, and get more good than he can by going to church. Then he becomes tired of staying indoors, and feels that he would like to cultivate the social element. He strays over to the neighbor's, then gets out on to the streets, and *finally* patronizes the saloon. Perhaps some of our young men are debating whether they shall attend church, as conscientious and good people direct, or whether they shall go where they can have most fun for the time being. In this case it may be that the church and saloon both hold out inducements in one sense of the word. Suppose, however, this new craze, the wheel, comes in right here. He goes neither to the church nor to the saloon. He goes off into the country, on a wheel-ride. I do not say that this is the thing to do, mind you, for I feel sad to see any young man go out on his wheel on Sunday because he can not afford to take the time week days. But let us go back to the question. Where would you rather have a boy of yours found on Sunday—in the saloon or off in the country, on a wheel? Of course you would rather have him at church and Sunday-school than at either of the places. But suppose it is either the wheel or the saloon. Is there any one who can for a moment think of calling *one* as good as the *other!* If he goes to the saloon he has already braved conscience and public opinion. He knows, without being told, that he is on the road to ruin. He voluntarily seeks the society of the lowest and most depraved? But is it so with the wheel? A great part of wheel-riding is done in no company at all; in fact, it is hard work to keep side by side with any one. If you get too close you are liable to have a collision; and when any part of your wheel, your body, or even your clothing, touches any thing, you lose your center of gravity and down you go.[*] The saloon is social in its tendencies. For reasons given, the wheel can never be very social—that is, while you are riding. The saloon favors late hours: the wheel emphatically directs that all riding be done by daylight. It is dangerous to ride after dark, especially in the country. The wheel takes you out into the free open air, usually into the country, amid the trees and green fields, and God's clear sky. The surroundings are calculated to ennoble, and this wonderful new exhilaration from vehement exercise stimulates one's *best* thoughts and feelings. It is the greatest encouragement I ever felt toward godliness. In fact, it leads one to look up to God with gratitude and thanksgiving. The atmosphere of the saloon, physically and morally, tends to *kill* spirituality. I believe the tendency of the wheel is to encourage a healthy, wholesome spirituality. I am sorry that our boys are riding so much on Sunday; but if the wheel is going to be the means of drawing our boys out of the saloons on Sunday, I feel that it is inducing them to make a tremendous step in a *better* direction. If we can get our boys into the open air, I think our chances are ever so much better for saving them.[†] I have wondered what our young men have said when they met this paragraph in the *Bicycling World*. I am inclined to think they have said to themselves, "Why, that Christian Secretary is an old mossback. He has stayed cooped up in his office so long that he does not even know what is going on in this great country of ours." And by the way, dear friends, I do fear that a good many of us who are professing Christians are in great danger of meriting the title of "mossback." When the Endeavor Society was first started, the biggest part of our ministers, and perhaps the greater part of our old deacons, frowned on the new venture, and I myself was guilty of suggesting that we had organizations and societies enough. We turned a cold shoulder toward it, and sermons were delivered in some pulpits against it. But the movement was of *God's* appointment, and not of man's, and it pushed through all opposition, and it astonished the world by showing what it could do and what it is doing. Now, I believe the wheel too is of God—a wonderful and precious gift to the present century. Why, just think of it! almost everybody must do miles and miles of walking. Business men spend a great part of their *lives* in walking. They wear out their boots and wear out their bodies in slowly tramping here and there. A man can walk four miles an hour; and even four miles an hour is very fatiguing to many people. With the wheel, eight miles an hour is a slow gait. With fair roads, almost any one can make twelve, and the boys often make sixteen without a bit of trouble. Ernest rode five miles in sixteen minutes, and I presume he could have gone five miles more in the next sixteen, without a bit of trouble. This was on a smooth race-track, however; but the road was not a bit better than most of our country roads *should* be, and, I verily believe, *will* be. Just think of it! when you are in a hurry, and it is desirable for you to see a good many people in a short time, with the wheel you can almost annihilate distance. Best of all, when you come to talk to somebody on business you are in a good frame of mind. In fact, it is a daily surprise to me to find that there is an invention right here before us that will make a sour and crabbed man good-natured. Yes, I have purposely tried the experiment of getting on the wheel just before supper-time, when I felt weak and nervous, and fidgety and cross. I have tried it when I felt sure that nothing in the world could help me. In half an hour I was strong, well, bright, happy, and cheerful, and pleasant to my wife and children. May be this is making a confession. Can't help it; it is too good (not too good to be true) to keep to myself. Our boy Huber, only nine years old, takes the same wheel that I ride, and runs all over the country with it, even though he can not touch the pedals with his feet much more than half the way round. After school he gives us a series of gymnastic performances out in the street between the house and factory. The wheel stands still for him—at least, it looks as if it did. While he climbs on, it looks as if he were going up a series of steps upstairs. Then he gets first on one side and then on another; puts his feet over the handle-bars, side-saddle fashion, stands up on the pedals without sitting on the seat at all, and yet I can not remember that we ever saw him get a fall. When suppertime comes he is rosy and happy from the exercise that it gives him. A few days ago a man was wanted who was about a mile and a half away. It was over some pretty long steep hills, but Huber thought he could master them. He did the errand and was back so soon that I scarcely missed him from his play. It is the nicest and most wholesome *sport* in the world for children, and there is real *utility* in the sport. It brings all mankind closer together. At our prayer-meeting last week some of the old people asked what should be done with restless boys who want exercise, and who want to go out into the country on Sunday. I ventured the suggestion that the boys should be permitted to get on their wheels and go to a Sunday-school at three o'clock in the afternoon, just two miles away. I said that, if the boys would take a seat in one of the classes, and listen to the instruction, and, as soon as school is out, ride straight home, I should not fear that such an amount of Sunday riding, and for such a purpose, would result in any thing bad.

A little way back I spoke of a race-track where our boys do a great deal of riding. It is true, we have wheel-racing like horse-racing;

---

[*] It is said that a very polite wheel rider once simply brushed a lady's arm while he was riding by the side of a canal. It threw him out of balance, and down he went into the water, and under it. As soon as he could get his head above the liquid he blubbered out an apology for his rudeness in having ridden so near her.

[†] Once more: It is just beginning to be discovered that experts on the wheel must not use either strong drink nor tobacco. The man who uses tobacco will surely fall behind; and I believe that quite a few of those who ride wheels have abandoned tobacco on this account. Tobacco strikes a sure and deadly blow at the best muscular development. May the Lord be praised that we are just beginning to find this out. I have before spoken of the fact that those who make great rides on the wheel choose milk in place of alcoholic drinks or even tea and coffee.

but so far the League of American Wheelmen have so vehemently opposed any betting or gambling that no cash prizes have as yet been allowed that is, among the league. The man or boy is expelled who is found guilty of betting or gambling, or even running for a cash prize. The prizes are, all of them, something besides cash, and the winner is put under bonds not to sell his prizes. Some of them have already a dozen wheels; and the question is, what they are to do with them. I think our league should be commended and encouraged in its steady and persistent stand against gambling, or running for money prizes.

Now just a word in regard to the expense of wheels. When sewing-machines first came around, they cost from $75 to $100—that is, a good one did. In course of time, however, machines equally good, if not the same thing, were sold for $12 and $15. I think there is no question but that the same thing will be true in regard to wheels. At the present time, however, there seems to be difficulty in making a really substantial wheel for much less than from $125 to $150. Manufacturers give, as an excuse for these high prices, that they are obliged to warrant wheels, no matter how much they are banged and slammed about by beginners. My own wheel has received knocks already that it would seem the best of iron or steel could scarcely be expected to endure. There have been some trifling breaks, but in every case a new piece has come promptly, without charge, to replace the broken one. Now, then, instead of condemning the modern wheel, and calling it a piece of the Devil's machinery, shall we not take it as a gift of God, and strive by every means in our power to have it used in a way that may glorify his holy name?

Before closing, permit me to say a word to those who meet wheels on the roads, and feel it to be a nuisance to turn aside a little to give them room. A good Christian man of my acquaintance seemed a little surprised a few days ago because I expected him to give me a part of the road because the hubs were so rough outside of the beaten track that no wheel could be expected to go over them. He said, as I passed them, "Why! has a body got to turn out of the road for *them* things?" I confess that it may seem that it is asking too much to expect a big heavy team to turn out of the beaten track just to let a wheel go by. But, dear friends, please remember that, even though a wheel can outstrip a horse, the rider is not expected to possess the brute *strength* of a horse. It is a *man's* muscles against a *horse's* muscles. Which is the best able to get out of the beaten track where it is a little rough? I think I might have turned out and given my friend the whole road; but it would have required immense strength on my part, and have given me a pretty thorough jolting besides. Where the sides are tolerably smooth, I prefer to turn out; and where I meet a team with a great load I often dismount rather than put them to much trouble. Ordinary Christian courtesy should dictate what is proper. In many towns wheels have been banished from the sidewalk by ordinance. Crowding us out of the public highway *also* would be a little unkind. The law, I believe, has pronounced the wheel a vehicle; and every vehicle of whatever description is entitled by law to half of the road. Of course, we meet coarse, greedy, unfeeling people. Our own State of Ohio is guilty of having a man of this latter class, who would not give a lady rider part of the road; and when he had crowded her off to where the road was rough, he drove his wagon over her wheel, after she had fallen in trying to turn out for him. After that he refused to permit her wheel to be placed on his load till she could get to the nearest town. The league took the matter up, however, and I presume our stupid friend has found out ere this that wheel*women*, at least, have rights.

Later.—Carrying packages and even burdens on the wheel is another matter that is almost undeveloped as yet. My attention was first called to it when I saw a young man not twenty years old take a girl who weighs 80 or 90 pounds, letting her stand with her feet on the coasting-rests, and leaning back on the handle-bar. He carried her around without any apparent effort for some little time. Some of you may suggest that it is easier to carry a nice-looking girl weighing 80 or 90 pounds than it is a package of merchandise that weighs only 30 or 40. This may be true; but I have been having fun lately in carrying our mail to the postoffice. We are half a mile from the office, and it is necessary to make five trips during each 24 hours. We used to hire a small boy, and sometimes it took him an hour to go to the postoffice with his wheelbarrow, do a few errands, and return. Before I knew it one of our older boys was carrying and bringing the mails on his wheel. One day I spoke almost reprovingly:

"Why, Frank, you have not got your mail."

"Oh! yes, I have. I got back some time ago." But when I looked questioningly he answered, "Why, I go every day now on my wheel, and yesterday it took me only eight minutes by the watch."

Well, I saw the point. I borrowed of Ernest his package-carrier; and by strapping on a half-bushel basket I now carry 30 or 40 lbs. without a bit of trouble. A wheelbarrow is not to be *compared* with it for ease of transportation; and when you talk about comparing the wheelbarrow to a wheel in speed — whew! Now, if the burdens can be supported low down, say by the coasting-rests, or still further down, near the ground, the difficulty of keeping the balance would be very much reduced; and I feel certain that there is no way in the world whereby the strength of a man can carry 100 or even 200 pounds, to be at all compared with the ball bearings and the pneumatic rubber tire. In the town of Oberlin I saw the mail-carriers delivering and gathering the mail on wheels. I do not know how far this fashion has been adopted; but I do know that it is going to be one of the shortest cuts in business the world has ever discovered; and what has been heretofore painful drudgery may be a delightful pastime. This paragraph is dictated after having carried a large package to the postoffice; a message to a railroad depot beyond; a purchase made at the drugstore; a deposit made at the bank; an order delivered at the meat-market; a bill for repairs paid at the wagonshop; another bill for repairs, in another part of the town. These commissions took me in different directions all together a couple of miles, and yet I was back in about 25 minutes, and I did not make any effort to hustle around either, and came home feeling refreshed and glad. One of the most difficult posts to fill in all our establishment has been that of the messenger boy; and I never expected to see the time when I could do it myself *profitably*, and at the same time have *fun* while doing it.

I have all my life, as you may know, been fond of "rushing things." I do not wish to be hard on the friends around me, neither do I like to be hard on horses when I am driving them; but there are many times in my life when every thing and everybody seems too slow for my mood. A great deal is to be accomplished in a certain time. I want to be in a dozen places at once. Now, the wheel comes in right here, and fills a "long-felt want." You can hardly imagine what a relief it is to my feelings to know that I can push the wheel to my heart's content. If I want to make a certain point or a certain place, there is nothing to hinder, and no wrong done to anybody, providing I do not run over them, even if I do just "make the gravel fly" in fetching a combination of events around to a certain climax; therefore you can readily understand why I say so often to myself, "May God be praised for this new and precious gift."

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

DR. MILLER "RILED."

The *British Bee Journal* has just "riled" me by one of its proceedings; and as my anger would cool off before it crossed the ocean I'll vent my spite on GLEANINGS. I refer to the bad practice of printing articles with the name of the writer at the end instead of the beginning. In a late number of the *B. B. J.* an article contains a statement somewhat startling in character; but whether it shall be received with implicit faith, or be considered a mere whim, depends something upon the reputation of the writer. So I looked for the end of the article, with the question, "Who is the writer?" The only reply I got was the very unsatisfactory one, "To be continued."

The succeeding number is now before me. Turning somewhat eagerly its pages, I find the continuation of the article, only to find again in the place for the signature, "To be continued." How long this state of affairs is "to be continued" I do not know; but in the meantime all the readers who are interested in the article are "to be continued" in a state of mind. Of course, no fault can be found if we admit that it is the right thing to have the writer's name given at the end. But isn't it a bad plan in general to put the name of the writer at the end? When you read an article in a bee-journal, don't you always look first to see who is the writer? And if the name of the writer is the first thing to be *read*, why shouldn't it be the first thing *printed?* Is there any good reason for having it at the end? "Takes less room at the end?" Why, you can print it in just as small type at the beginning as the end, and surely it will take no more room one place than the other. "Yes, but it doesn't look so well." Now, look here, Mr. Printer; are the comfort and convenience of your thousands of readers to give way for your notions of typographical appearance? Out upon you!

Now, it may be that, if GLEANINGS would take up this matter, and try to show the guilty parties the error of their ways, at least some of them might be induced to amend.

Marengo, Ill. C. C. MILLER.

[Well, now, doctor, we (that's the junior editor and the printers) are glad that you are riled, not at our esteemed cotemporary the *British Bee Journal*, but at GLEANINGS, for it is easy to see you intended to give us a clip over the shoulders of the *B. B. J.* Our custom has been to put the name of the writer at the end of the article. *We* have wanted it at the beginning; but A. I. R. doesn't take kindly to it. May be if you will keep your wrath nursed up we shall be able to make the change. Joking aside, we will put the signature wherever our readers desire it. In renewing, let us know your preference.]

NOVICE OF OLD—AN OPEN LETTER.

Dear Novice:—Now a novice no more, it gives me much pleasure to grasp your hand and say with what zest I read your productions in the "Old Reliable," when it was conducted by the lamented Wagner. Your "trials, troubles, and tribulations" were amusing when so humorously described over the *nom de plume* of "Novice;" but I doubt that they were the source of much satisfaction to you, although I judge you endured them very philosophically, even if you were but a "novice." I wish you would, when the spirit moves you, give us the history of your early apiarian experiences, because it would not only "renew the youth" of many who, like myself, are in the "sear and yellow leaf," but would convey much instruction to the "tyro" in apiculture. Permit me to suggest a title for the (forthcoming?) work; viz., "Reminiscences in Bee-keeping." After you ceased writing for the *A. B. J.*, I lost track of you until lately, in the August number of the *Progressive Bee-keeper*, I learned that you are still alive and making things "hum;" in fact, there is something very *e(a)rnest* in your business methods. So you would like to know who the "Assistant Editor" of our *Canadian Bee Journal* is? Well, Bro. Novice, if you will favor the apiarian department of our Industrial Exhibition (which is held annually in Toronto during September) with your presence, I doubt not you will be most cordially welcomed and lionized (you know we Britishers are fond of lions) by the aforesaid "Assistant Editor."

I intended, when I began this "screed," to tell a snake-story; but if I do not go to bed very shortly I shall probably dream of snakes which will require the services of a doctor to *tinker* at the internal economy of OCTOGENARIAN.

Amigari, Ont., Oct. 24.

NINE OR TEN COMBS IN A TEN-FRAME HIVE—WHICH?

Is it of any benefit, to 40 to 50 colonies of bees that are kept for extracting, to have in the upper case or extracting-super nine frames instead of ten? Is it not more convenient for extracting? or will it bother again the same time? We are using the Langstroth 10-frame hive, 14¼ inches inside width. JACOB WAGNER.

Amana, Ia., Oct. 17.

[The only reason for using 9 frames instead of 10 in a ten-frame hive is because some bee-keepers seem to think there is an advantage in having the frames a little wider spaced—that is, 1½ instead of 1⅜ from center to center. If the apiarist is not careful in spacing, the combs will in time be bulged wider and wider; and the result is, he is obliged to take out one of the combs so he can get in the nine; but with those who are beginning to use self-spacing frames, crooked and bulged combs will soon be things of the past. In our own experience, we get more brood from 1⅜-inch spacing than from 1½; we also get truer and better combs. This matter was fully discussed on page 491, 1890. Perhaps we ought to say this: For extracting, there may be an advantage in having 9 combs in a ten-frame super, because the nine will hold the honey of the ten, and the nine can be uncapped in a little less time than the ten. But we question somewhat whether the honey is as nicely ripened in *deep* cells as in the *shallow*.]

HOW TO GET POLLEN OUT OF THE COMBS.

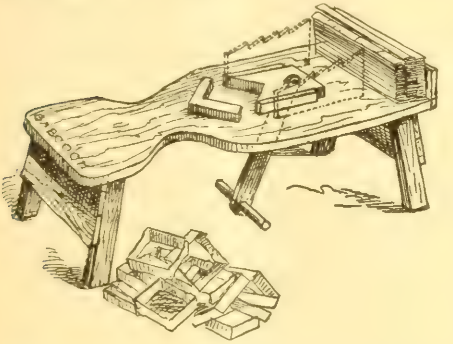
After extracting the honey from the brood-frames or extracting-frames, is there any known means or way that the pollen can be taken from the cells without injury to the combs? I believe it has been so stated by some one I do not remember just where), that in combs stored away without honey in them, the pollen becomes so dry that the bees will not use it. If that be the case, it would be to the detriment of the bee-keeper.

Gunn City, Mo. JAS. A. ADAMS.

[The best use you can make of the pollen-stored combs is to hold them over till next spring, then give them to the bees to stimulate brood-rearing. It is a difficult matter to get pollen out of the combs artificially. It has been recommended to soak such combs in water for a time and then, with a stream from a hydrant or fire-pump, wash out the pollen. We have never tried it but the plan is said to work.]

BABCOCK'S SECTION-PRESS.

I inclose herewith a pencil sketch of a section-press of my invention. It is not patented, and can be built for 50 cts. It is a free gift to all bee-keepers. Please pass it around.



The dotted lines are a rack to hold the open sections. Prepare a bundle and place them at your right. Put them on the rack, a handful at a time. H. C. BABCOCK.

Lemoore, Cal., May 6.

THE ALL-WOOD FRAMES; SELLING POOR QUEENS.

I am thoroughly converted to the all-wood old-style frame, but I am not prepared to accept the extra wide and thick top-bars and the Hoffman frame. I want the old-style all-wood frames, but I want the top-bars an even inch wide, and the same thickness as now, ⅜. That width will give us a ⅜ bee-space between the frames when combs are spaced 1⅜ from center to center. I hope Mr. Root can be induced to make this change, and make it a standard for all-wood old-style frames, end-bars one inch, bottom-bars ⅞, the same as now.

I have no sympathy with the practice of selling a poor quality of queens to other people. Selling to others stock that we know to be worthless is very poor morals. I favor breeding to the highest possible standard. Some bees are good comb-builders, others are not. I once bought a high-priced select tested queen. She was all she was represented to be; but her bees would never build an ounce of comb in the upper story. They would swarm as soon as the brood-chamber was full. Her daughters and granddaughters were the same. Other bees in the same yard, with the same treatment, built surplus comb right along with but little or no swarming; therefore I have adopted a rule, that any queen that swarms out from under empty sections meets a violent death as soon as I can replace her. The same rule should apply to queens that will not winter a colony that went into winter in good condition. I have no sympathy for kind-hearted people doctoring up a sick colony in the spring, to save a worthless queen. Some people seem to regard a queen as so much cash. So she is, if she is a good one; but if worthless, she is no better than any other bee; in fact, she is worse, for she will raise a lot of drones to mate with and spoil some good queen. Good wintering should be a strong point in selecting breeding-queens.

In my yard, some colonies will pile in the burr-combs, while others will leave the frames comparatively clean. If all other conditions and qualifications are equal, I supersede the burr-comb queens; the same way with queens whose bees are vicious. They are superseded as soon as it can be done without loss. I am one who thinks a careful selection, from generation to generation, of the bee-life, will make great improvement in the stock. Do not sell inferior queens. Kill them.

PHILO S. DILWORTH.

Ingram, Pa., Nov. 3, 1892.

SLUMGUM FROM THE SOLAR WAX-EXTRACTOR; W. H. SOMERFORD SAYS THERE IS VALUABLE WAX IN IT.

Friend E. R. Root:—After carefully reading H. R. Boardman's report on page 771, Oct. 15, in regard to the slumgum, or residue, from a solar wax-extractor having no wax left in it, I will back your assertion by giving my experience concerning solar wax-extractors, for I used a large one in Cuba, where the sun does shine even hotter than here. The size of it was 26x44 in.; and for melting cappings it was good enough; but when it came to melting up old foul-brood combs, or any other comb that had been used in the brood-chamber, it was not what I wanted, for it would always leave from 25 to 40 per cent of the wax in the slumgum, or so much that a hired man did all, or nearly all, of his cooking with it while it was in constant use. And some piles of the same slumgum from the solar extractor had been thrown out, and had been in the weather for perhaps as long as three or four years, until it had been burrowed through by ants, and soaked by rain, and heated by sunshine until the time I took it up and cooked it in a 300-gallon brass sugar-kettle; and, to be sure, I secured a fine lot of very good dark wax that the solar extractor had lost in slumgum. In fact, I consider, after using a 300-gallon brass kettle to render over a ton of wax in, that any solar extractor is very wasteful, except in cappings; for experience has taught me that, to get wax out of old combs, they must be soaked thoroughly, then boiled, and stirred and skimmed of all floating wax, then stirred and left to simmer down and cool. When cool, and soaked on top, take the cake out and set it up edgewise; then with a sharp hatchet or ax peel off or divide the cake as near the top as you find little round shotlike lumps of wax. When divided, break up, resoak, and again boil the half containing wax, with *acid;* and what is lost I'll guarantee will not be sufficient to run a thrasher-boiler, as Mr. Boardman did, in place of coal.

W. W. SOMERFORD.

Navasota, Texas, Oct. 23.

TREGO'S FIVE-BANDED BEES; THEIR GOOD TEMPER UNDER AGGRAVATING CIRCUMSTANCES.

I notice in a copy of the *American Apiculturist* (p. 124), Alley's comment on your description of the behavior of your Punic colony, where he says, in the fifth sentence, "There is not a colony of any race of bees that would not behave as bad," and yet was it not claimed that the only time it was *possible* to *make* the Punics sting was during swarming time? Allow me to tell you how I served the colony of our five-banded breeding queens. It is raining to-day, with north wind; temperature 66°, and I have just been testing our goldens to see if I could make them sting. Here is the way I went at it. If any one can tell me a better way to make them sting I will try it:

I removed the cover with a jerk, took off the enamel cloth ditto; lifted out a frame of brood, and gave the hive six kicks, severe enough to make it bounce; then I blew my breath on the bees in puffs, and gently, after which I moved my hand rapidly over the frames, then took up a bee and mashed it thoroughly to get the poison scent, and again moved my hand over them and blew on them; but not one stung me or stood in the air before my face. When I got through kicking the hive, the air was full of bees; but they simply arose from the combs, circled around, and piled in at the entrance; and before I closed the hive (which I did as soon as I got through teasing them) all were on the combs or inside of the hive, and perfectly quiet. All of this with no smoke near, nor has there been to-day nor for weeks. We draw on this colony nearly every day for brood to start queen-cells; and yet we had to extract their combs clean three times to make it safe for the queen and bees for us to handle the combs during July, which shows that they have plenty of energy in the right direction.

Swedona, Ill. S. F. TREGO.

BEE-HUNTING; A GOOD FIND.

Dear Friend Root:—While camping out for a week last August, within 25 miles of Mt. Hood, besides bringing down some fine game our party had the pleasure of cutting a bee-tree. Early in the morning, with axes, a saw, iron wedges, a maul, and tin pails, we started for the forest. The bees had awakened before us, and a fine string of workers pouring forth from a hole about 20 feet from the ground in the side of a huge fir-tree indicated a good find. After the usual amount of sawing, chopping, and driving of wedges, down came the tree and out came the bees. They were angry at receiving such treatment, and began to resent it as only an angry bee can. It is needless to say they were not around long until they made themselves felt. After some sawing and chopping we got at the honey, and, besides securing a good colony of bees, we got about forty pounds of honey. J. W. JENKINS.

The Dalles, Or., Oct. 20.

[Why, friend J., if you were really a whole week within 25 miles of Mount Hood, why didn't you tell us something more about it, and something more about that wonderful country? The thought of Mount Hood as I saw it fairly makes my heart bound now. I was not then able to climb mountains; but I shall remember the glimpses I got of it whenever we had a clear sunny day, as long as I live.]

THIRTY-FOUR POUNDS PER COLONY; A GOOD WORD FOR HOFFMAN FRAMES.

With the help of the A B C and GLEANINGS we have secured an average of 34 lbs. per colony, spring count, with every stock, except one, amply supplied for winter; no honey until after July 4. Your improved Hoffman frame on tin rabbets gives entire satisfaction. Thanks to friend Robbins (page 725) on "How to Prevent Increase." I think I can make the plan work all right, as I practice something similar.

Corunna, Ind., Oct. 19. S. FARRINGTON.

THE HIVE AND HONEY-BEE.

This book, written by Langstroth, revised by Dadant, and translated by the latter into French, has lately been given the honors of a re-translation into Russian, by Mr. G. Kandratieff, editor of the Russian *Journal of Apiculture*, and Director-in-Chief of the Imperial Opera at St. Petersburg. The work is an exact translation of the French edition, and contains 482 pages. This is a new honor, both for father Langstroth and the Dadants, which is indeed well merited.—*American Bee Journal.*

OURSELVES AND OUR NEIGHBORS.

For our light affliction, which is but for a moment, worketh for us a far more exceeding and eternal weight of glory. II. COR. 4:19.

Lay up for yourselves treasures in heaven, where neither moth nor rust doth corrupt, and where thieves do not break through nor steal.—MATT. 6:20.

Pardon me, dear friends, if I continue to talk about this matter that has come up so often of late in regard to our outdoor rural industries. A certain class of people have been saying that farming doesn't pay; and there has been a strong tendency for our boys, to say nothing about the older ones, to fall in line and hunt around for something else to do, because everybody *knows* that farming doesn't pay. I tell you, farming *does* pay; and before I get through I feel sure that a great part of you will, to a greater or less extent, agree with me. The professing Christians among our readers should certainly agree, even if others do not. I am not going to teach farming under this head—not this time, any way; but my remarks in that direction will come rather under the second of the two texts I have chosen.

A few weeks ago it was announced in our Saturday afternoon prayer-meeting that the semi-annual conference of the Congregational Churches of our county would meet in Litchfield, Medina Co.; and then the pastor called for delegates. There were several nominations. The first person could not well go; ditto the next; the third one said flatly that she *wouldn't* go; and then the office of going as delegate began to be pushed from one to another as if it were some very disagreeable piece of drudgery, and that it was a kind of imposition to ask any one to go as a delegate only nine miles from home. Now, I have not been at conference very much for a good many years; in fact, I had fallen into a way of thinking that it was well enough for people who had no regular employment, but that business men could not be expected to neglect business and go and sit two whole days listening to dry sermons preached by country clergymen, during the middle of the week. Does the above sound rather harsh and uncharitable? I think it does; and, to tell the truth, I am ashamed of it; but I have been getting, for a few years back, into something like that way of thinking. This Saturday afternoon, however, they carried the matter rather to excess, and I felt ashamed of myself. I arose to my feet and said, "Friends, I will go as a delegate if you wish me to; and at this season of the year, when we have comparatively little business, I will take any office and perform any duties the church may call upon me to perform, as well as I know how. During the spring and summer months, when our business is at its height, I hope you will excuse me from such duties, and also excuse Ernest and Mr. Calvert. There *are* times when it is a Christian duty to *stand at your post* a good deal as a locomotive engineer is expected to stand at his post."

From the moment I stood up and volunteered to take the office that nobody wanted, I felt happier. I was glad when the day came to go to conference, and a special spiritual blessing seemed to attend me during the whole session.

A word about dry sermons, etc. There was just one sermon that might be called, by a good many, dry and behind the times. It was a revival of the old doctrine of election. If any of you do not know what that is, don't stop to inquire; you are just as well off. A young minister, who delivered the sermon, received so much criticism, right and left (of course, good-natured and kindly criticism), that very likely he will not preach in that line much more.

The pretty country church was filled with people, and they were bright, wide-awake, intelligent people, fully up to the times, even if they were mostly farmers and farmers' families. In fact, a great part of the blessing I received came from the fact that I was among not only laboring people, but good, pure-minded, godly people—those who are not only intelligent and well educated, but who love righteousness and hate iniquity—gathered together to talk over the evils that threaten the church of Jesus Christ. To get acquainted, and lay plans for protecting our people and our church, was certainly inspiring.

The sermons and lectures were not all from country clergymen, either, for we had some rare good talks from college professors who stand high in our State and nation; and one of these forms the subject of my talk to-day. Prof. H. C. King, of Oberlin, O., gave us a lecture in the evening on education and its relation to community. In this talk he presented us with a lot of statistics that had been gathered with considerable pains and expense. He first asked the question, "Where do our college graduates and our great men in the interests of education come from?" Most people have got into a way of thinking that *towns* and *cities* offer great advantages in the way of education. Come to think of it, I rather think they *do*. And then most people jump at the conclusion that it is a misfortune for a boy to be obliged to grow up in the country. He has not the facilities for getting about among the people that a town boy has. He can not attend lectures, meetings, and the various societies, that the town or city boy does, and for various other reasons he labors under a great disadvantage; and on this very account our farmers give up the farm and move into town in order to facilitate giving their children an education. If a *town* boy enjoys advantages that the farmer's boy does not, the *great cities* must afford still greater advantages; therefore the city boy, especially if his parents are well to do, so he does not have to work all the time, would be likely to far oustrip the town, village, or country boy. Good logic, isn't it? But facts are proverbial for being stubborn. Let us turn to the hard statistical figures.

How many successful and really valuable college graduates are brought up in the city, and with all the advantages of the city? Less than *three per cent*. I do not suppose you are astonished, for you have heard this before. Prof. King did not say any thing about successful *business* men; but I want to ask you to look about your own home and see where your great and good men come from—you may include men of capital, if you choose, but, please, only those who are making a good use of their capital—who are using it to help community in general, and hold up the standard of righteousness and purity so far as he can. Where do *these* men come from? Were they brought up in a city, with the advantages that at least moderate wealth gives? I think you will agree with me that it is just the other way. Moderate-sized towns have furnished rather more good rising men than the cities; but the *great bulk* of the college graduates—the men of brain, bone, and muscle, come from the *farm* or *farming villages*. They are children of parents who did not make farming pay in the sense that most people would use it. You all know pretty well, I think, if you use good sense and look at the matter squarely, that the farms and farming towns are *constantly* furnishing boys of integrity and worth to fill important and responsible places. These boys are the outcome of something that made it necessary for them to work hard for a living. The boy who is brought up in ease, whether in town, city, or country, never amounts to very much—that is, this is a great general rule. There are exceptions, of course. Some boys will *bear* ease and pampering, and still develop into great and good men. But it seems that, to develop to its highest extent, either the physical, mental, or moral, there must be an incentive that nothing can give except poverty, or, at least, moderate poverty. Why, you know it by your own experience. The most profitable schooling I ever got in my life was when I was obliged to walk two miles and a half every morning, and chop all the wood besides, for a fair-sized farmhouse and farmer's family. Yes, one year before this I had the advantages of a city school. I was living with relatives, and didn't have very much to do. The high school was so near my home that I had quite an easy time of it. A sudden change to wood-chopping, a walk of two miles and a half, and farmers' fare, built me up bodily, *mentally*, and, I hope, *morally*.

Why, it is only the same thing that has come to light in the wheel business, mentioned in other columns in this issue. God intended that we should use our brains and muscles—yes, he expected us to use them vigorously. If we don't, they will become dwarfed and comparatively useless. Prof. King told us that statistics show plainly and overwhelmingly that the men who stood in the front as the saviors of our nation were those who had been brought up in the country or in country villages—villages where the greater part of the people are farmers and have their farms near by their homes. Of course, there is an advantage in living where there are sidewalks and good roads. We can train our muscles in some better way than pulling our feet out of the mud and clay. There is also an extreme in both directions. No doubt many boys have been deprived of the advantages of education because of *extreme* poverty; but a hundred more have suffered because they had *too easy* a time. Now then. The very men and women who have been complaining, getting disheartened and discouraged, and possibly getting soured because farming does not pay, may have been greatly blessed in what they regarded as a calamity and a misfortune. Why, my good friend, your earnest, heartfelt prayers have been answered by this very thing you lament. You have been praying for the influences of the Holy Spirit, for a spiritual revival in your hearts, and in the hearts of your families. God could not answer that prayer and give you the worldly prosperity you had in mind at the same time. In his infinite loving kindness he has spared you from great trials and great calamities that would have been sure to come with wealth. We have been told a little fable where a good man held out a valuable coin and a piece of gingerbread to a child. "Which will you have?" said the philosopher. The child chose the gingerbread, without any hesitation. My friend, are *you* going to choose the gingerbread?

A very good friend of mine, who worked hard all his life on a farm made the remark that he had earned just about enough to educate his children—no more. One of them bids fair to become one of the leading ministers of the day. Suppose this man should say that farming does not pay, and keep in mind only the low level of worldly prosperity in dollars and cents. He who brings up, educates, and furnishes the world with a man who can stand up before men, even in our great cities, and teach men to love righteousness and hate iniquity, has done a *thousand times better* than if he had accumulated—shall we say millions? Why, the comparison is ridiculous. If you, my dear friend, have brought up and educated even one boy or one girl, and have placed that child where it will battle for the right and put down the wrong, you have laid up *treasures in heaven*, and that is exactly what our text means.

What does *money* amount to in comparison with something that will help the world toward righteousness and purity? In the effort to educate your children you may have incurred a mortgage that sickness or disaster may prevent being paid, even at the time of your death. Which is better—to die with your property unincumbered, and leave your children with no education, or to feel, in your dying moments, that you have fitted them to take care of themselves, and battle for the right, even though your legacy be a mortgage for them to lift and pay? Why, what boy or girl is there who would not gladly and lovingly take up the task of paying off such a mortgage? The education may have lifted them from *darkness* into *light;* and a little earnest hard work that may be required in lifting the mortgage will give them just the hardship they need to a perfect development of character; and it often takes our boys and girls not only from 20 to 30, but from 30 to even almost 40, to become so fully matured and so rooted and *grounded* in industry and good principles that they will be able to withstand temptation. Perhaps you have been tempted to feel sour, and may be you have caught the infection and contagion—for I regard it as nothing else—so you are just now ready to move off from the farm and go to town. Don't do it. I am sure worldly prosperity is not only more dangerous, but more *damaging* in the end, than what thousands regard as poverty. "What shall it profit a man if he shall gain the whole world and lose his own soul?"

Now then. Would more worldly prosperity tend to the saving of *your* soul and the souls of *your children?* You may say that you would risk it, but *I wouldn't*. The present age and the times seem to make the temptation greater than ever before, to believe that money is the *one* thing needful. Beware of Satan's promptings and suggestions, and pray that God may give you grace to say, "Thy will, not mine, be done." Very likely he *has* given you just what the Preacher of old asked for—"Give me neither poverty nor riches."

Please do not understand me as recommending mortgages as a rule. At the present time a mortgage on the farm or farming lands is to be avoided, and to be incurred only as a last extremity. But we should remember this: There are things a thousand times *worse* than a mortgage on your property. You had better have a mortgage on your property, and lose it, than to go through life living on what belongs to other people—or, if you choose, stealing from your neighbors in a way that the law can not touch you. I have known people who owed bills right and left—bills at the grocer's for sugar and flour; bills for coal, etc., who could have paid all these things by putting a mortgage on their homestead. Better put a mortgage on your homestead and *lose* it than to steal after this fashion from your neighbors. Farming is not the only thing that does not pay; and when your grocer, through competition, sells you sugar so close to cost that his profit hardly pays for the string and paper to do it up, it is a *wicked* thing to evade paying him simply because he can not collect it legally. In fact, you have no business letting him *try* to collect it. Yes, there are some things worse than mortgages. You had better have your home mortgaged, and *lose it*, than to see your children take the downward road to ruin, because you kept them out of school, that their work might obviate the necessity of a mortgage. Letting them grow up ignorant and vicious is worse than to incur a mortgage and lose it.

But there is a better way yet, and I am sure that God will always direct us in a way that we may avoid wronging our neighbors and avoid keeping our children out of school, and avoid mortgages. To reduce expenses, give up luxuries. My good old mother used to make starch out of potatoes, to save buying it; and she used to twist up papers enough to last all winter, so she could light the lamps without using a match — thus saving matches. Of course, this was years ago; but getting back to this sort of economy even now would help us out of the trouble, and do us good besides. Of course, we want to be reasonable and rational. When matches are only a penny a box it will not pay you to twist papers unless you are badly out of work and want something to do. But there are thousands of things that our grandparents did without, and were comfortable and happy too, that we might do without, and find *more* comfort and happiness. Of course, I do not mean to recommend the shortsighted penuriousness that results in loss instead of gain. At one of the Endeavor meetings I repeated in substance the point made by Prof. King. Before I had sufficient time to sit down, the president of the county union Endeavor society repeated in clear ringing tones the first of my two texts:

> For our light affliction, which is but for a moment, worketh for us a far more exceeding and eternal weight of glory.

Now, do you not see the wonderful meaning, and with what inspiration Saint Paul *chose* those wonderful words? The fact that farming does not pay, or does not pay very well, is really our "light affliction"—that is, we look at it as an affliction; but it is really for the time being —"but for a moment," as Paul has it; and then just think of the grand summing-up—"worketh for us"—that is exactly it. If we are patient, industrious, and faithful, the whole thing *works out itself*. And what is the final ending? Why, "a far more exceeding and eternal weight of glory." Yes, "*glory*" is the word. When you keep on farming, even though you are tempted to be discouraged, and think it does not pay, if you endure to the end your reward comes—not in finer houses than your neighbors have, nor in broader acres, necessarily; but in seeing your children grow up accustomed to work and hardship. They learn on the farm to brave the storm and the wintry blast; they learn to *prefer* the stimulus of sunshine, frost, and outdoor air, to any stimulus that saloons or wine parties can give. They learn to *thank* God for the opportunities he has given them among men, rather than because they are *obliged* to work, and then take that other step and accuse their neighbors of being cheats, and to wind up by saying there is no room in this nation of ours for *honest* men.

Is it not sad, dear friends, to think there are those among us who have become so deluded and led away as to give voice to such sentiments, and then fold their hands and give up? Why, these "light afflictions" are answers to our *prayers*. They are from God's own hand. They are really exhibitions and indications of his loving kindness; and yet we oftentimes grumble and complain. Are there other occupations that give us the same discipline and drill as does farming? Well, I hope there are; but why do not the statistics and our observation show us that these other occupations furnish as many scholars, teachers, and real sturdy stalwart *men* (in the best sense of the word) as do the farmers' boys of our United States of America? I am proud of the fact that my early life was, at least the greater part of it, spent on a farm, and a rather poor farm at that. I would rather be a *farmer*, and wear farmers' clothes, and put up with a farmer's *hardships*, than to have the finest office in the finest city that our land can furnish; and, come to think of it, it seems to me that I have *heard* something a good deal in that line, with a little different wording. Let's see: "I had rather be a doorkeeper in the house of the Lord than to dwell in the tents of wickedness." The word "doorkeeper" means one who stands on the threshold; from which we see that David would rather enjoy the *least* of God's favors than to enjoy for a season all the tinsel and glitter of a wanton life, only to be cast away from God's favor at the end. What better exhibition of common sense *could* there be?

HIGH-PRESSURE GARDENING.

BY A. I. ROOT.

FARMING DOESN'T PAY.

A few days ago I saw two good stout men and a team standing in front of our tool-house. As they did not seem to be doing any thing, pretty soon I got around to where they were and inquired what they were waiting for. They said they were sent after the potato-digger, but it was gone—somebody must have borrowed it. I do not know how long they had stood there, but there they were when I came around. I felt sure it was there, right in its place, hanging up in plain sight, over the manure-spreader, and there it *was*. Perhaps they did not see it because it was hanging up. It was not hung so high, however, but that a man could reach it easily while standing on the ground. In fact, it was the most conspicuous object in the whole tool-house. You say, perhaps, that this was only an accident, and that such things happen with the best of us. Perhaps they do; but I can not believe that any real live wide-awake man—one who is interested in his business, and anxious to get to work, would make a blunder like this. We estimate two men and a team worth 50 cents an hour; early in the morning they ought to be worth a little more, if any thing; and it always worries me exceedingly to see a team with men standing idle. Sometimes one of them stops to tell stories, to look at the daily paper, to talk politics, and that, too, while all the rest have to await his movement. I said, *some* of them. I did not mean the horses, and I think I had better beg their pardon.

Now about this matter of saying things "ain't there" when they are right in plain sight. In employing all sorts of help I have had a good deal of this kind of work. Such blunders are almost always made by *half-hearted* people. One who likes to dig potatoes, and knows he has something worth digging, who has got his work all planned, and enjoys making things fly, will see at a glance every thing there is in the tool-shed, even though it be filled up with various tools, as ours is almost the year round. It is a positive *sin* to have so little interest in your work, and so little energy; and if you think you are going to get a living in this way, you will be disappointed at every turn. After you have found that *farming* doesn't pay, and have tried something else, you will find that there is not *any* thing that pays, unless you wake up and shake yourself, and put your whole heart and soul into your work. When I plan for a certain job, I go out before breakfast, or just before dinner, and not only see that the right tool is in place and in order, but, if it is not too heavy, I get it out in front of the tool-house. Then I get the appropriate doubletrees and neckyoke, and have them on the spot. By the way, we have two doubletrees and two neckyokes, just to avoid having the team and men stand still while somebody runs away across the lots after one or the other. Just now farming *is* close business, I admit, and therefore we must make it our constant study to avoid hindrances and delays. If we are so unfortunate as to have men work for us who are dull, we must keep them in mind and keep an eye on them. The two men I have been speaking of are not working for me. I think they are raising potatoes on shares; so when they could not see the potato-digger, it was, mostly, their own loss. Perhaps I should explain that said potato-digger is one of the shovel-plow kind—that is, a shovel-plow with some rods sticking out behind. It will dig a pile of potatoes in a day, and do it quickly and easily. The only drawback about it is, about ten per cent or more of the potatoes are liable to be left on the ground. If you are going to fit your ground for wheat, you can take them out after the harrow throws them out on the surface. Some of them you will probably never get at all, and you will have "volunteer" potatoes for the next season.

HAPPY SURPRISES.

I have talked to you several times about the happy surprises a Christian has a right to expect. That is not quite it, either; for if we were *expecting* them all the while they would not be *surprises*. Perhaps I should put it this way: He who does his duty, and tries to have his heart right before God, will be continually meeting with happy surprises; and these happy surprises are among the brightest things one meets in this world. And I think a *farmer* also has a right to happy surprises—that is, if he is a good farmer, and is honest, faithful, and hard-working; and if a man is *both* Christian and farmer, these surprises ought to make him very happy indeed. Well, now, I am not a very good Christian, and I am surely a very poor example in farming; but for all that, God sees fit to cheer my way with many happy surprises, to overbalance, as it were, the disappointments; and there are three of these surprises that I wish to tell you about to-day. The first one is in our New Rose celery. While I was in California our boys started some New Rose celery along with the other kinds. The plants became too large to stay in the greenhouse, and they had to be put somewhere; so we made two rows and a half down in the creek-bottom grounds. It was so wet we sort o' tramped them into the mud; and then the rains and floods came, and I made up my mind that that lot of celery planted out so early was just *another* waste of time and expense. It held its way, however, after a fashion, until some time in July. By this time some of the lowest portions were drowned out entirely; so we took the half-row and filled out vacancies, and that left us just two rows forty rods long. When we filled out the rows the plants taken up were, some of them, large enough for market; but they were green, hard, and unbleached. These plants grew nicely; and this convinced me that celery can be moved at almost all stages of growth; and, if done properly, it will grow right along.

Some time during the fall these two rows of celery began to be something immense. We banked it up as well as we could, but other crops had been planted so near it that there was no dirt and no room to get any. I thought of drawing on some boards; but the other crops that were crowding the celery would be injured by tramping and handling the boards, and so we banked it all we could, and let it go, thinking to bleach it in the cellar after it was taken up. Saturday, Nov. 5, we decided to draw it in, as there had been several pretty hard freezes. How much do you suppose we got from those two rows forty rods long? *Six great wagon-loads of celery!* That is a stunner, is it not? But what do you think the heaviest plant weighed? *Just 9 lbs.*, roots and all, after we had shaken off all the dirt we could pound off. Now, then, if any celery-grower among the readers of GLEANINGS has had celery like that, let him "stand up and speak his piece." Where would the "new celery culture" be if *all* the plants grew like that? To tell the truth, it was rather a new celery culture of itself. It had suckered out, and each sucker was as large as an ordinary stalk of celery. One immense root held them all together. I wonder how these folks who sell all sorts of celery by the dozen would manage with this crop. Of course, this weight included green leaves and all; but I think that that one stalk would trim up at least 6 lbs. of celery—that is, when properly bleached. In regard to the quality, the suckers that were under ground, and thoroughly bleached, were the most delicious of any thing in the celery line I have ever tasted in my life. The hands who were taking it up tried it, and all decided in the same way. The two rows were planted four feet apart, and they were, perhaps, from six to ten inches apart in the row. This great growth was due to the gravelly sub-soil that underlies the rich loam, and which held the water during our recent dry spell, so that the celery kept right on growing. The ground had also been heavily manured for several years previously. Surprise No. 2 is—

GROWING MUSHROOMS BY STEAM HEAT.

More than a year ago we tried growing mushrooms in the cellar. The heat of our manure was too far spent, I presume, when the spawn was put in, so we never got any mushrooms. While I was in California the boys tore down our mushroom-bed and used the manure in various places. They said it was all dead, and of no use. Along in April, something very much like mushrooms began to grow in the greenhouse between the radishes and lettuce. I asked one of them about it, and he said it was toadstools that came from some old manure they had bought. These toadstools, however, grew in such wonderful profusion that they had to be pulled up like weeds, to get them out of the way; and several basketsful were dumped on the compost-heap. It did occur to me several times that these might be edible mushrooms; but I did not get time to have some of them cooked, and so the matter was dropped and forgotten. A few days ago those same toadstools began to come up again on the same beds. These beds were over the new agriculture, and the exhaust steam, that has been turned on since we commenced using the steam to warm the factory, down under those stones, seems to have been just the thing to suit the mushrooms. Of course, the ground is rich. This time I took some over home, and Mrs. Root cooked them for supper. They were the most delicious mushrooms I ever tasted: but to make sure that they were not poisonous we just tasted them all around, and then set the dish away until the next morning. Exhaust steam in many cases will certainly be *cheaper* than manure, to furnish the requisite heat. Some of the agricultural papers tell us that the manure from spent hot-beds is just as good as or better than it was before. This is certainly a mistake, as you will see by the tomato book. If not, why do those who use manure hot-beds on a large scale throw away the residue as so much sawdust? Now for surprise No. 3:

TILE DRAINAGE ALL PAID FOR WITH THE PROCEEDS OF A SECOND CROP IN A SINGLE SEASON.

The advertisement in our local paper resulted in selling our turnips and cabbages to such an extent that we were obliged to buy more to supply the demand. A farmer living five miles away brought me a load of beautiful cabbages and turnips. I asked him, of course, how he managed to get such a crop of fine vegetables during this disastrous season. Said I, "What manure did you use, friend K.?"

"Why, Mr. Root, did not use any manure at all."

"Look here, my friend; I know by the twinkle in your eye that you did *something*. Now, what was it?"

"Well, these things grew on a piece of new land. It was upland—in fact, on one of the highest hills in the county. A year ago last spring I underdrained it, and put on potatoes. Then I gave it a good manuring. Last spring the drainage did not seem to be quite sufficient, so I put in a second series of underdrains and did a good job, fixing it according to my own notion. I had a good crop of potatoes this year, and they sold at a good price. After the potatoes were off I bought some purple-top globe turnip-seed of you, and sowed the whole piece to turnips."

Here he stopped; but there was still a twinkle in his eye that encouraged me to question him more, and he finally said:

"Well, Mr. Root, I have received money enough from the *turnips alone* from that ground to pay for all the tiles and all the expense of laying them."

Now, here is a story for the *Drainage Journal*, which is, I think, the biggest it has ever had. I am quite a Yankee at questioning, as you know, and so I went on:

"But, Mr. Kraver, you must have taken some pains to market your crop in order to get that amount of money out of the turnips."

"Well, yes. I have worked pretty hard for a month back in selling my stuff. Yesterday morning I got up at half-past two so as to get a load of turnips and cabbages into Akron in good season. I sold them all out, and got home at night with the cash in my pocket. I do not get up that early every morning, mind you; but I can do it when circumstances seem to demand it."

I paid him almost $10.00 for the load of stuff he brought me, and it was not much more than half a load either. I think, if he tried hard, he could get on that wagon enough to bring him $25.00, and the team he had could draw it. Now, friends, how does this sound when we hear so much about farming not paying? Medina County is really about as poor a portion of the State as any we can find, for truck gardening; and this piece of ground in question is certainly not *above* the average.

NOTES OF TRAVEL

FROM A. I. ROOT.

NEW MEXICO.

This Territory is much like Arizona in many respects. Our trip through it on the Southern Pacific, however, in the month of February, did not present the beautiful scenery in the way of vegetation—the vegetation of the desert—that I found three years ago in the month of November. On my first trip the cacti and other desert plants were just finishing their season's growth, and I saw many beautiful flowers. In February, however, the new growth, in consequence of the winter rains, had just started. The geological wonders, however, in the way of rocks of different colors, mountains and desert, were as attractive as ever. They did not interest Mrs. Root, however, quite as much as they did myself. I presume she was getting to be tired out with so much travel.

Our first stop was at El Paso, on the Rio Grande. The town of El Paso had grown to such an extent in three years that I could scarcely find a single landmark to remind me of the town as I saw it on my visit before. It is not a *town* any more, however, for it is a fine *city*. There is no end of beautiful buildings, and buildings of great size too. I had an invitation from one of the readers of GLEANINGS to call on them at Las Cruces. Now just a word about the names of these Mexican towns. They are, for the greater part, named after some geographical feature, or in honor of some of the saints in the calendar of the Roman Catholics. Thus, El Paso means "The Pass," probably because it is here that a great bridge is located at the Rio Grande, and the various government houses for duties, etc. In fact, this great bridge separates (or unites, let us hope) the United States and Mexico: and as El Paso is the point where exchanges are made, the business relations of the two countries was probably the reason why El Paso received such an influx of business. It is certainly destined to be one of the great cities of the region. Mrs. Root preferred to remain alone at El Paso while I went out on the Atchison, Topeka & Santa Fe railroad to meet my friend Mr. Thomas Brannigan, one of our Medina County men who went to New Mexico some twelve years ago. A little out of El Paso is an immense smelting furnace for working the product of the mines. One can scarcely form any conception of these great structures, belching forth smoke and flame, until he sees them. To carry on these mining industries profitably, it is very likely that the wealth of some great corporation is needed. The buildings and apparatus are beautiful; and standing, as they do, out among the rocks and mountains and desert plains, they look strange enough. I suppose one reason for the location pretty well out of town is because of the smoke and poisonous gases that are liberated. These latter are sent forth in such volume, I am told, they sometimes kill all the vegetation in the vicinity. In the desert of New Mexico, however, there is not much to kill, unless water is brought on for irrigation. You will notice by the map that the A. T. & S. F. Railroad goes along the banks of the Rio Grande. The words Rio Grande mean the great or grand river; and when one speaks of the banks of the Rio Grande you would naturally think it something fine. To tell the truth, however, there are not any banks at all—that is, most of the time; and, in fact, there is not any river at all a great part of the time. During my visit in February, the Rio Grande was, every now and then, entirely dry—that is, so far as the eye could see. The stream, what there was of it, passed down through the porous sand and gravel, and then came out again to the sight when the soil seemed more compact.* Almost every thing seemed a desert waste until we reached Las Cruces.

The Rio Grande, like many of the desert rivers, changes its bed so frequently during times of great freshets that it is a serious and unceasing trouble to the railroaders. Every little while the road is washed away, and must be built again on a new course. I presume that some time, by the aid of irrigation plants, the Rio Grande and other desert rivers will be held in restraint. The name Las Cruces means "The Crosses," coming, probably, from the old mission churches and their adherents.

Just as we were coming into the place one of the passengers pointed out to me the home of my friend. He has charge of an apiary belonging to a well-to-do official, in some government capacity, if I am correct. This home, or plantation, as it might be called, seemed like an oasis in the desert. It was a large two-story frame building, such as we see here in the east, but it was surrounded by large broad piazzas, more like those of the planters' houses in the South. As soon as I made myself known I was welcomed by the proprietor, and all the rest, with the greatest hospitality. The grounds, the surroundings, and the fruit-gardens, were all beautiful; and the contrast is all the more marked when one can go around through the town, because this seems to be almost the only building in the place that looks like what we would call a *house*. The town is very old; and I hope the friends there will not feel hurt when I say it looked to me more like a village of mud houses, fit only for savages or the inhabitants of some far-away islands of the sea that we read about. Even the stores, groceries, and hotels were made of this same adobe brick—brick simply dried in the sun.

When I first came into the town I went into a store to inquire my way. I saw the sign, "Store," over the doorway, and I thought they could, of course, give me the information. In the first place, there was not a window to the store; and when I got inside I could not see any goods—at least, nothing that I should call goods; and, furthermore, there was not anybody in the store who could talk a word of English—I confess to getting a little homesick. However, after friend Brannigan, with a nice modern carriage, with a couple of smart ponies, drove me around the place, I felt a little more reconciled—at least, I did after I got out into the country and saw the fruit-ranches and the alfalfa-fields. We visited a bee and fruit ranch. The proprietor showed me some orchards and gardens away out there in the desert, that would do credit to almost any home in the suburbs of our great cities; apples and grapes and raisins; yes, and honey of their own raising. He showed me his little garden of exotic plants; and then he asked me if I would like to see them haul and spread manure, the way they do to produce these immense growths of fruit, trees, and all sorts of vegetation. Well, they do not use any *manure-spreader* at all in New Mexico. They just make an irrigation canal, and take the thick muddy water from the Rio Grande. They run this through the grounds, and the water is so nasty and muddy that it leaves a thick scum or sediment wherever it flows over the ground. This sediment is equal to concentrated manures for fruit, alfalfa, or almost any thing else. Why, the rushing waters, laden with their fertilizing treasures, made me almost wild to have a ranch in New Mexico; but then, when I thought of those mud huts for homes, that were almost the rule in that region, I felt almost homesick again.

---

* Unless immense reservoirs are constructed to catch and store the waters during the wet season, I do not see how irrigation is to be carried much further with water taken from the Rio Grande. In fact, I am told there are a great many points where every bit of water in the river is appropriated. By digging down through this loose porous gravel, that permits an underground current, and making tight cement bottoms, no doubt a large amount of water can be secured, and this will probably be done soon.

May be Las Cruces has more real houses than I gave it credit for. But Mrs. Root was not along; in fact, I had not seen her for *four or five hours!* This was by far the longest period we had been separated since she met me in San Francisco. Besides, we were both beginning to feel a terrible longing for home and the children. With all these explanations it is not very strange that, instead of staying two or three days at Las Cruces, I began to make inquiries in regard to the first train back that evening. At suppertime my resolution was somewhat shaken by meeting some of the miners from Organ Mountains. These mountains, in fact, had considerable of a look like my old friends Superstition Mountains. There was not any turret nor battlements away up in the clouds, but there were some sharp peaks that looked more like church-spires than they did like mountains. An old miner who had received an injury in the mines told me a good deal about them, and said people had climbed up those spires, and they all gave me a pressing invitation to go up and see the miners work in those mountains next day. Friend Brannigan said, further, that there were some mountains right back of these that were almost as white as snow, and it was not snow either; it was mountains of gypsum, or plaster of Paris. By the way, I had had a glimpse the day before of one of these gypsum mountains. All at once I startled the passengers by exclaiming, "Just see that white mountain! What can it be?" They all jumped to the window and caught a glimpse of it. Then the train whirled us among the hills, out of sight; and when we had got to the spot where we thought it ought to be, it was not there any more. A good many explained its disappearance by saying that it was a mirage; but I am sure it was a plaster-of-Paris mountain. The railroad did not happen to go where we could get a glimpse of the mountain again. For several days after leaving Las Cruces I felt bad to think that I did not shake off my feeling of homesickness and go off and explore those wonderful mountains. Never mind; when we get out of debt again—if we ever do—perhaps the boys will send me off to finish my explorations. In the next issue I will try to tell you something about the strange city of Paso del Norte, just across the river from El Paso. It gets its name, probably, from this branch of the Rio Grande, "del Norte" meaning the northern branch.

A KIND WORD FROM AUSTRALIA.

Friend Root: Let me thank you for the good I have got from your books, particularly "What to Do," etc. That book did me good, and strengthened my hands. I was feeling in the dark, and your gleam of light showed the track. Deep cultivation, heavy manuring, and good stuff are my text-words, and I have succeeded very well in small things, such as strawberries, tomatoes, fruit, and poultry, and the best shops jump for my produce. Besides this, you have helped, by your writings, other poor men over here, and encouraged them and taught them. Let this gratitude of ours sometimes dwell in your mind, and repay you for your trouble.

Sidney, N. S. W., Sept. 19. T. A. BOARD.

GLEANINGS IN BEE CULTURE

A JOURNAL DEVOTED TO BEES AND HONEY AND HOME INTERESTS.
ILLUSTRATED SEMI-MONTHLY
36 PAGES 7×10
$1.00 PER YEAR

For a small moment have I forsaken thee. ISA. 54 : 7.

WE have to-day, Nov. 10, a heavy fall of snow, and every thing looks decidedly like winter. We usually do not have much snow in our locality before the first of December.

WE have just been advised of the safe arrival in Australia of two or three Italian queens that we sent from Medina some forty days ago. We sent out, toward the latter part of the season, something like three dozen, and so far have heard from only four or five queens.

OUR friend J. M. Jenkins, the supply-dealer of Wetumpka, Ala., has ere this, we presume, taken a new helpmeet. There was a brief intimation of the coming event in a letter ordering another lot of catalogues for 1893. GLEANINGS extends congratulations.

WE omitted to state, in our footnote to Mr. Crane's article on page 837, that he has a cone, or sleeve, of perforated metal, that slips right over the cone top of the smoker. This sleeve has an air-space between it and the cone proper, and, being fastened securely, the top may be removed without burning the fingers.

EXPERIMENTS WITH GLUCOSE: HOW THE BEES TAKE TO THE PURE STUFF.

IT has been intimated several times of late, that bee-keepers feed glucose to bees to get comb honey. We have all along doubted whether this would be practicable, and accordingly, during the past summer, we ordered a small keg of the finest glucose made, to test the matter for ourselves. We knew the bees would not take to it very kindly, but were greatly surprised to find that we could not get them to even *smell* of it; and Mr. J. B. Hains, of Bedford, Ohio, who wished to prove the fallacy of the thing, says this is his experience. We experimented with three colonies of different temperaments, and they all seemed alike to regard it with the same disfavor. Finally we thought we would see, one day, if we could not *force* it down 'em. We dipped our finger into it, and allowed the glucose to stream all over the cluster of bees; and while we were watching them they did not even take the pains to lick each other off, and we believe, if we had dosed them much more, the whole colony would have been killed.

When the stuff first came we thought we would sample it. It looked beautiful, clear as crystal, and as thick as nice well-ripened honey on a winter day. We sampled it, taking a good big spoonful. The first sensation was not particularly bad; but as the stuff began to melt in the mouth it was almost nauseating. It reminded us very forcibly of old rotten potato parings. (We never eat such things, but judge of their quality by the smell.) We invited, in turn, several others to taste it, and they all regarded it as positively bad.

Now, the point of all this is right here: If it is impossible to make bees take pure glucose of the finest quality, it is impossible to produce pure glucose comb honey by feeding; and all the talk we have had regarding the possibility of making glucose comb honey is a waste of words—that is, if our experiments were conducted carefully. This is possible, and, we fear, may be done: Twenty or thirty per cent of glucose may be added to honey, and fed to bees; but the pure article, never.

Again, the nasty flavor of glucose is so characteristic, that we believe we could detect the smallest quantity of it in honey, either comb or extracted. We believe we would about as soon rely on a carefully educated taste as on an elaborate analysis. Both together ought to be accepted as good proof of the purity or impurity of honey.

We want to give, right here, fair warning that those chaps who are adulterating with glucose, or contemplate doing so, had better go slow. In the first place, it is impracticable — yes, impossible — to get pure glucose comb honey. In the second place, 25 or 50 per cent mixtures will tell their own tale.

Later.—Since writing the above we have had the pleasure of a visit from John H. Larrabee, lately of the Michigan Apicultural Experiment Station, at Lansing. In consequence of his connection with the station he has, of course, made many experiments in apiculture; and among them was feeding pure glucose and glucose mixtures to bees. The pure corn syrup, the bees almost refused to take, although by starving them to it he has got them to store in a very few cells. Practically, then, his experiment would agree with ours mentioned above. By putting from 25 to 50 per cent of glucose into sugar syrup or honey he could get them to take it down.

Mr. Larrabee will go back to Vermont, and commence again on his own account the business of honey production. He is a progressive and intelligent bee-keeper; and although he is not now connected with an experiment station, we hope he will not entirely give up the field of investigation.

MORE ABOUT THOSE PUNICS; ONE REDEEMING QUALITY.

SOME of our friends may be interested in knowing how those Punics are behaving of late. We have been watching them narrowly ever since our first reports. Regarding their bad traits, we have nothing to take back, but, on the contrary, we are sure that we did not condemn them any too severely. But among all their naughty habits it would be a little singular if we did not discover at least *some* partially redeeming quality. Well, we have found *one*. They are the best defenders of their home against robbers, of any race of bees we have ever known. Indeed, when the robbers are the worst, we find we can pull the cover off their hive and leave their combs exposed for hours at a time; and although the robbers will at first pounce on to them fiercely, in a few minutes they begin to find they have "got the wrong pig by the ears," and then they hover about more cautiously. Those "little black devils," as one of the boys calls them, will stand in military array along the edge of the top-bars; and the *first* robber bee that comes within smelling distance will be met on the wing, and perhaps jerked down between the combs, and that is the last of Mr. Robber, for two or three Punics will very soon finish him* up. Our experiments were made somewhat late in the season; but we believe it would be safe to move the cover off at any time of the year, if the hive be well shaded. This trait is a very desirable one; but at the same time it is overbalanced by so many bad ones, that, if all Punics are as naughty as ours (and reports seem to show it), bee-keepers having them will soon brimstone them. We might add, in this connection, that this same skill in defending their home renders them terrific robbers, for no ordinary bee is a match for a Punic in a hand-to-hand combat. One time last summer, when the bees got to robbing, we noticed that there were two Punics to one Italian, helping themselves to the ill-gotten gains; and this, notwithstanding there were 200 times as many of the yellow bees as of the black in the apiary. Suppose the situation were reversed, and the honey-house door should be left open—what then?

THE RURAL NEW-YORKER.

AFTER I had given the *Country Gentleman* such a compliment as I did in the last issue, I felt a little troubled to think it might look as if I intended to place it ahead of the *Rural New-Yorker*. Well, in *some* things I do think it perhaps a little better authority; but on the other hand, the *Rural* has done a work in testing new things recommended to the farmer, and in sifting out frauds, that no other agricultural paper has done. In fact, our enterprising seedsmen can hardly *start* an old thing under a new name without having the *Rural* come after them with a sharp stick in double-quick time. There is somebody back of the *Rural New-Yorker*, with such a real honest energy and vim that it tempts us to smile, even if he does, in his vehemence, bear on a little too hard at times. Long live the *Rural!* and, in fact, it *has* lived long already, for I remember walking two miles and a half to my grandfather's, more to look over the *Rural* than almost any thing else when it was first started, about forty years ago. Another thing, the *Rural* is broad and comprehensive. It takes in the topics of the day, the new enterprises, and the general news. It upholds godliness, and it sits down on tobacco and whisky with no uncertain sound. Even if it *is* an agricultural paper, it makes it its business to pitch in lively when our country demands the help of all good men. Again, it was one of the first to inaugurate the plan of getting opinions of eminent men on all the serious questions of the day. Last, but not least, it has just reduced the price to only $1.00 a year. If they are going to keep it up to its standard, and keep up its many and varied illustrations, as they have done in years past, it will be almost ridiculously cheap; and no one need be afraid to take it into the family circle and have every one, from the smallest child up, look at its pictures and read it all through. I said, a little time ago, that it did not give place to advertisements of patent medicines. It seems, however, that it does accept certain kinds of advertisements of this class. I do not think even this best, but perhaps the *Rural* folks are right and I am wrong. It is their own affair, any way.

A. I. R.

THOSE IMPORTED QUEENS.

WE have just been advised by our forwarding agents in New York that they received breeder's certificate, and advices from Havre, that crates of Italian bees were to arrive. They notified us that the packages could not be found on the manifest of the steamer when it came, nor did they receive any notification from the steamship company or United States customs regarding the arrival of bees. The queens came, however, and on investigation they and all the bees were found to be absolutely dead from fumigation on account of the quarantine regulations for the prevention of the cholera epidemic then threatening to enter the port of New York. We refused to receive them, of course, and we suppose ere this they have been burned. The case is a little peculiar. While the breeder in Italy is supposed to deliver, ordinarily, queens to us in good order, it is hardly fair that the shipper in this case, Miss E. Bianconcini, of Bologna, Italy, should stand *all* the loss. There is no hope of getting any damages from the quarantine authorities, as they are governed by the motto of the greatest good to the greatest number. In this case we propose to stand half the loss, and even then it will be rather heavy, as a consignment of fifty imported queens is rather expensive. As, in all probability, quarantine regulations will be in force again next summer, it is quite doubtful whether we shall be able to get any more imported queens for another season's trade, for it would be utterly useless to have bees shipped over only to be fumigated to death with sulphur. We have sold out all we had, except one or two queens almost superannuated, that we kept right along just because they were raising such nice queens.

---

* We suppose we ought to say *her*, but *her* is too effeminate here. E. R.

DO BEES MAKE HONEY OUT OF SUGAR? FEEDING SUGAR, AND SELLING THE PRODUCT AS HONEY.

THIS matter was so emphatically settled years ago, that feeding sugar will not make honey, that I am a little surprised to see it coming up again. I am still more surprised that our good friend Prof. Cook, and the editor of the *Bee-keepers' Review*, should seem to be teaching in that line. In the back numbers of GLEANINGS are recorded some very careful experiments in this direction. In order to satisfy myself I fed a single colony of bees a whole barrel of sugar. Sections were filled and capped over so as to rival in beauty almost any thing that could be brought forward in the way of honey made from natural sources. But it was not honey at all. We uncapped the sections and removed the liquid honey, as our friends would call it, and placed it in sauce-dishes right beside the syrup before the bees had had it at all. I did not find anybody who detected a particle of difference in the taste. It was sugar syrup before it was fed to the bees, and it was just exactly the same kind of sugar syrup after the bees had put it in combs and sealed it over. Very likely many people, without thinking, would call it honey because it was in honey-comb; but ever so many *did* say it tasted like sugar syrup, when they were not told any thing about it. Another thing, *it did not pay*. In every one of my experiments the excessive feeding caused the bees to go to rearing brood and secreting wax. In fact, the wax scales fell to the bottom of the hive so they could be scraped up; and the consequence was, the sugar cost more than the honey could possibly be sold for. I know there is a wider margin between the price of sugar and that of nice comb honey just now; but I am sure that no one, even now, can pay expenses, even if the product is sold at the highest market price, and sold as honey.

At different times in the history of the honey business there have been found people foolish enough to undertake the matter on a large scale; but every such attempt has been a failure. Furthermore, I am sure there are a dozen well-posted bee-keepers who are living now, who made the same experiments I did, and the result was just as I have stated it. The whole thing is old, and has been gone over repeatedly. Very likely some other additional experiments have been made since this matter has been revived, during the past season; but if the experimenters will own up, I am sure they will agree to what I have stated above. On page 274 of the *Review* for October we find the editorial I have alluded to, as follows:

> #### SHALL WE RAISE SUGAR HONEY?
>
> Last spring I cut off the discussion upon this question because even its bare mention caused so much excitement that it seemed impossible to reason coolly or secure fair decisions. Recently published reports showing that even the best chemists and a class of forty students could detect no difference between "sugar honey" and the best honey from basswood and clover have again brought the subject to the surface. If, as Mr. Hasty has said, sugar honey gratifies the eye, tickles the palate, and nourishes the body; if it fulfills every requirement of floral honey; if, as Prof. Cook says, it *is* honey, why need it not become a legitimate product of the apiary?
>
> Opposition to discussion has been urged, on the ground that sugar honey could be produced only at a loss. "If it can't be raised profitably, why discuss its production?" "Let some one raise a pound of sugar honey at a profit, *just one pound*, 'they' said, and then—perhaps." These were some of the expressions used. To settle this point I have been experimenting a little the past season. From the feeding of 150 pounds of sugar I have secured 135 pounds of finished comb honey. The sugar cost $7.50; the honey would certainly sell for $20.00. This honey has been awarded first premium at fairs, been furnished to neighbors, and placed before visitors; yet its origin has never been suspected. This has been done simply as an experiment, and has completely proved what I already believed to be true.
>
> Now, if sugar honey can be raised at a profit; if it is really and truly honey, I ask, in all seriousness and earnestness, what are the objections to its production and sale? There is no occasion for indulging in florid rhetoric and exclamation-points; simply lay aside preconceived notions; allow *reason* to reign supreme, and coolly and calmly say why this extension of the bee-keeping industry would be wrong or work any injury to the pursuit.
>
> I think there is no better time than the present in which to settle the question, and I propose to devote the November *Review* to its discussion. Prof. Cook's article will answer for a "leader"—a much better one than I could write.

A visitor came into our office a few days ago and picked up the *Review* and read the above; then he made a remark something like this: "Mr. Root, what would one unacquainted with our industry say to find this in one of our leading bee-journals? And suppose some of our newspapers that wanted to make a sensation should copy the above, and pass it around. What would be the effect on our industry?" I went carefully over the whole thing a second time, to see whether any thing was said against selling the product as *honey* produced by feeding sugar; but there is not a word. I am not at all afraid it can amount to any thing like the oleomargarine fraud, as there is *money* in the latter, and I am sure there is not in feeding sugar. Furthermore, there is not any thing known that can be fed to bees, so as to make it pay, that will compare with even *poor* honey. It might in looks, but I am sure it would not please customers. If the thing were possible, how does it happen that no such product has ever been successfully placed on the markets? When there is a poor yield of honey, prices go up, and the markets are often destitute of a decent-looking article. It will not do to say that people have not found it out; for it has been discussed and proposed ever since bee-keeping has been an industry. Almost every bee-keeper in the business suggests it sooner or later; and unscrupulous venders of new-fangled hives and new-fangled secrets, from Mrs. Cotton up, have proposed feeding sugar and selling the product as honey.

How about friend Hutchinson's experiment where the product tasted like honey, and could be made at a profit? Well, my opinion is, that, by some hook or crook, some honey was gathered at the time of the experiment, thus increasing the yield, and giving it a honey flavor. I am sorry to reflect on one so accurate as the editor of the *Review* is, but I can think of no other explanation. A. I. R.

WHAT A PUDDING

That quaint old expression of our forefathers is so apt. We think of it daily when we look back ten years and recall how Victor Bicycles have outstripped all rivals.

What a pudding we have in the Victor Cushion and Pneumatic Tires, Victor Spring Fork, and the like.

No wonder Victors lead!

Let us send you a catalog.

SPECIAL NOTICES.

GLEANINGS FREE THE REST OF THIS YEAR TO NEW SUBSCRIBERS FOR 1893.

As is our usual custom we make the above offer to assist our present readers to introduce GLEANINGS to their friends. We will in addition give you, as a premium for all new names secured, a cash commission of 25 cents on each new subscription. It must be a *new* subscription. A change from one member of a family to another, or any like device, would not be securing a new subscription, therefore we prefer that you send your own renewal, if due, along with the new subscription secured.

3-INCH NETTING OF NO. 19 AND 20 WIRE NOT FURNISHED.

At the last minute, just before going to press, and after our page on wire netting is printed, we find that the manufacturers had so little demand for the light weights of 3-inch netting wire No. 19 and 20, that they do not list them this year, and therefore the cheapest thing we can furnish for pea brush is either 3 inch No. 18, or 2 inch No. 20, both of which cost 90c a roll, 1 foot wide and 150 ft. long. Please make a note of this in connection with what we say in full-page announcement.

MAPLE SYRUP.

If we can not offer much in the way of extracted honey we are prepared to furnish choice maple syrup, in one-gallon cans, at $1.00 per gallon in 10-gallon lots or more. For a less quantity we charge $1.10. We shall not be able to furnish much maple sugar till the new season opens in the spring, as we bought up and sold last spring all of this that we could get. There is plenty of good syrup in this vicinity, which we can procure and furnish at above prices, and guarantee it strictly pure maple.

HONEY PRODUCED WITH THE DOVETAILED HIVE.

In connection with the honey described opposite, we are most pleased with the fact that it was produced in our Dovetailed hives with section-holder arrangement. After Mr. Ball got his first lot of these hives three years ago and put them in use, he wrote that he could secure from ⅓ to ½ more honey, with less work, than with the old-style L. hives he was using, and he has since had several carloads, and will have another carload within a few weeks. We regard this as one of the best testimonies we can have, that this hive is a success.

DISCOUNTS FOR EARLY ORDERS.

Only two weeks remain in which to secure the 5% early-order discount on hives and supplies for next season's use. After Dec. 1st the discount drops to 4%. Quite a number have taken advantage of this offer, and we expect to hear from many more during the next two weeks. If you who have dealt with us are getting better offers nearer home, and prefer to have our goods so as to be uniform with what you have, we trust you will communicate with us, stating circumstances, and we will try to arrange prices to your advantage. We don't want *all* the trade there is, but desire to hold present customers and make new ones as well.

PRICE OF WIRE NETTING REDUCED.

We have just made a new contract with the manufacturers for our supply of wire netting and fencing for the coming year, and we call your attention to our ad't on another page, where you will find that prices are greatly reduced. They are not quite as low, however, as the special carload we offered two months ago. Of this we have sold out all the 18, 24, and 60 inch; but we still have a stock of the other widths. As we have an extra large stock of the 4-foot on hand we will make the following very low prices on this width only from now till Jan. 1st, 1893, and for shipment from here:

1 to 4 rolls, only $3.50 per roll.
5 to 10 rolls, only $3.40 per roll.
10 to 20 rolls, only $3.30 per roll.
25 rolls or more, $3.20 per roll.

These goods are fully equal to any thing we have heretofore sold, and these prices can not be duplicated anywhere, and are offered for only a limited time in order to reduce stock. Remember the size is 2-inch mesh, No. 19 wire, 4 feet wide, and are full rolls, 150 feet long. The other widths in stock, and prices, are as follows, all 2 inch, No. 19:

	1 roll.	5 rolls.	10 rolls.
12 inches wide	$1 00	$ 4 50	$ 8 50
30 " "	2 50	12 00	22 00
36 " "	2 80	13 50	26 00
42 " "	3 25	15 50	30 00

¾-inch staples for above at 15c per lb.

CLOSING-OUT PRICES ON SECTIONS.

While we do not acknowledge that the first quality sections we have been furnishing the past year are inferior in any respect to any heretofore furnished by any manufacturer, we have, nevertheless, realized that perfection was not yet attained, nor the cost of making reduced as low as it ought to be. We have felt that, unless we did improve our method of making sections, we might get behind in the race. It is our constant aim, in all kinds of goods we make, not so much to get the price down to the lowest offered anywhere, but to furnish goods of superior quality so that the slight increase in price over some offers made shall be much more than made up in quality. During the past year especially we have made great advances in this direction, not only in our own judgment, but also in the opinion of great numbers of our customers who have expressed themselves. We have planned, and are building improved machinery for making sections, which will cost upward of $1000 or more, by which we hope not only to cheapen the cost of making, but also and more especially, to make them more uniformly perfect in workmanship and finish. They will be smoothed both sides in a specially built machine, and reduced to a uniform thickness. These machines are not yet completed, and will hardly be in operation for several weeks yet; but they are far enough along so we look with assurance for the anticipated results. Now, to come to the subject set at the head of this notice, we have in stock over a million of choice sections made in the old way. They are choice goods, well made, and as good as any one can reasonably ask for; but we have too many of them; and in order to work them off we propose to offer them at prices that will make them move if there is anybody in want of sections at all. The surplus is of other widths than the standard 1⅞. We have about

250,000 $1\frac{15}{16}$ inch, open top and bottom;
70,000 $1\frac{13}{16}$ " " " " "
150,000 1¾ " " " " "
350,000 7 to foot " " " "
60,000 1½, 7 to ft., and $1\frac{15}{16}$ in., open 4 sides.

We will furnish any of the above for a limited time at the following net prices, which are not subject to any early order or other discounts, and for cash with order:

1000, $2.50; 3000, $7.00; 5000, $11.00; 10,000, $20.00.

Those who can use a larger quantity will please write, naming the quantity wanted. We have also some 85,000 of 1⅞ inch, and 40,000 of $1\frac{15}{16}$ inch No. 1 cream sections that we offer in connection with the above at $2 00 per 1000; 5000 for $9.00, or 10,000 for $17.00. These are choice, well-made sections, except in color. The retail price of our No. 1 white sections, standard size, will hereafter be $3.00 for a single thousand, and a deduction for greater quantities, up to 5000, of 2½ per cent for each additional 1000, making 2000 at $5.85; 3000 at $8.55; 4000 at $11.10, and 5000 at $13.50. Prices of larger quantities on application.

NEVADA COMB HONEY.

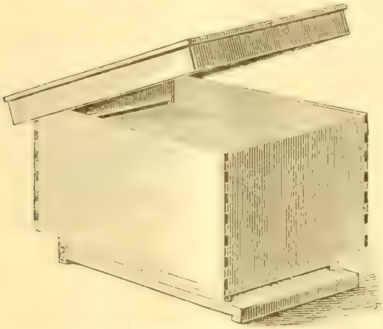
As our car of comb honey just arrived as we were going to press for last issue, we did not have time to report on it after opening up. Now that we have an opportunity, we desire to say that it is the finest lot of comb honey we ever set eyes on, and you don't have to credit our eyes alone for this assertion. All who have seen it add a like testimony. Mr. J. A. Buchanan, of Holliday's Cove, W. Va., who handles many tons of honey every year, and a good judge, writes, in remitting for 18 cases received: "This is the finest lot of honey we have had for years. It came in perfect condition." Some brokers in Cleveland wrote inquiring prices; and when they found our prices one to three cents higher than they had been paying for good white honey they thought they could not do any thing with it; but after seeing it they changed their minds, as the orders are coming in freely from them. Nothing would please us better than to place a section of this beautiful honey on the table of each of our readers, if that were possible. Some of the sections are snow-white, and filled clear out to the wood on both sides, top and bottom, without a single pop-cell next the wood, but a perfect sheet of white capping. They are also filled so full that there is a net weight of 25 to 28 lbs. of honey in many of the cases, though they contain only 24 sections 1¾ inches wide.

If you haven't enough honey for your home market, and are not too far away, order a crate of this and you will have no trouble in selling it at a good price. A single case or two are not so likely to ship safely as four or more, which we can crate together in such a way as to carry without breakage. The prices at which we sell are:

In lots of 1, 2, or 3 cases, 18c per lb.
In lots of 4 to 8 cases, 17½c per lb.
In full crates of 9 cases each, 17c per lb.
Five full crates, or 45 cases, 16½c per lb.

OUR NEW OUTSIDE WINTER-CASE.

The reports of this year and our own experiments last winter justified us in the belief that a sealed cover for outdoor wintering, with packing material above and around the brood-nest, was the correct method. In accordance with this idea we modified our winter-case for Dovetailed hive by giving it a telescope cover (see cut). This permits of using the old cover on the hive without disturbing the sealing and at the same time affords better access for pouring your packing material around and on top of the hive. The bottom inside edge of the case is stopped up with padded sticks as before, so that the space between the hive and the case is closed up. We do not think it necessary to go to the extra expense of an extra bottom for the winter-case. It is not the bottom that is to be kept warm, but the top, and that should be sealed and protected. Our extensive experiments last season prove this.



OUR NEW WINTER-CASE.

PRICES FOR 8-FRAME DOVETAILED HIVE.

New dovetailed winter case, including cover and padded sticks, 50c each; 10 for $4.50; or 100 for $40.00. Winter case, nailed and painted, 75c each; 10 for $6.50. For those who want winter-cases for their Simplicity 10-frame Dovetailed hives, the price will be 10c each more than above prices.

GARDENING FOR NOVEMBER 15.

We take it for granted that crops are pretty much all gathered. In our locality we sometimes let cabbage and turnips stand until Thanksgiving. It is rather risky for cabbage, however, and sometimes risky for turnips. At other times, however, turnips make quite a growth during this month and the first of next. On this account we almost always have a late sowing that may or may not amount to any thing. Parsnips and vegetable oysters, of course, will stand any weather. All you need to look out for is that they are not frozen fast in the ground when the market offers a big price for them. The real gardening, then, must be under glass. Cloth will answer at this season of the year for protecting plants that are already up and growing; and, under favorable circumstances, in might do to start some seeds. But these must be moved into the greenhouse later, or else glass must take the place of cloth.

The most important vegetable to push just now I know of is Grand Rapids lettuce. The intensive gardener should have lettuce in all stages of growth every month in the year. Seeds sown under glass, right off now, will come up and make considerable growth, even though you have no heat from manure or steam. Seedling plants may also be transplanted. I would put them 7 inches apart each way, making the rows so that the plants form an equilateral triangle, one plant at each corner, as explained on page 121 of the tomato book. At this season of the year I would rather have lettuce in the cold-frame than in the greenhouse, because you can remove the glass whenever there is a warm rain. If the plants are put the distance apart I have recommended in the above, there will be no danger of rot nor disease, providing you air them and give them rain whenever the weather will permit. There is not much danger from the sun so far south as it is now, of the plants getting too hot, even if the glass is left on. Better look out in the middle of the day, however, if the sky is very clear. If, when you tilt one of the sashes, hot air and steam come out, your plants are pretty near the danger-point, and need air. We have some very nice Grand Rapids seed, received of Eugene Davis, the originator, that we can furnish as follows: ¼ oz., 5c; ounce, 15c; pound, $1.75; 5 lbs., $7.50.

The plant that would come next to lettuce, in our opinion, would be spinach. Ounce, 5c; pound, 25c; 5 lbs., $1.00. This is even more hardy than lettuce, and will grow all winter long under glass, providing the sash are put a little apart to give air; or, better still, have the sash made of glass slats, which I have heretofore described. Corn salad will also do well if treated like the spinach.

You can sow Eclipse beets now under glass. As it takes beets a long while to grow, they will be just right for greens in February. We got 15c per lb. for beet greens for a long while last season. Eclipse beets, oz., 5c; pound, 50c; 5 lbs., $2.00.

If you have neglected providing cabbage-plants for the cold-frame, you can sow the seeds now under glass. They will bear almost as much exposure as spinach. We can furnish March's best strain of Jersey Wakefield stock seed; ounce, 20c; pound, $2.50. Cauliflower is a little more delicate than cabbage, but you can manage it if you take a little more pains.

Cress, or pepper-grass, is about as hardy as lettuce. Ounce, 8c; pound, 50.

Egyptian, or winter onion-sets, will do nicely managed as spinach under glass. If the sets are put out now they will be fit for bunch onions in January and February. Per quart, 10c; peck, 75c; 10c per quart extra if ordered by mail.

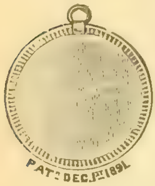
I think American Wonder peas can also be raised profitably under glass. We are going to make a trial of it this season, and report.

Radishes are even easier to raise under glass than lettuce. Scarlet Globe will give the earliest; but Wood's Early Frame furnishes nicer radishes a little later. Prices, ounce, 10c; pound, 75. If any of the above seeds are wanted by mail, add to the usual price 9c per lb. for postage and packing.

DADANT SHALLOW EXTRACTING-SUPERS.

In raising comb honey it is generally considered best to give the bees only as much room as they can occupy at once, usually one super. Considerable heat is required in comb-building and the work of the hive; and if given only the amount of room they can easily occupy they will work with better effect than if given twice as much room as they need. The same argument will apply in securing extracted honey; but as the full-sized frames are generally used for this purpose, it was not so easy to contract the amount of space to the capacity of an ordinary super. For this reason there seems to be a demand for shallow extracting-supers; and this is no new idea, for many, especially the Dadants, have been using it a number of years. To meet this demand with the regular Dovetailed hive, we are making shallow extracting-frames, 4½ inches deep, outside measure, just like the old-style all-wood frames, without a comb-guide, and giving about 4 inches in depth of comb surface. By putting 8 of these in an ordinary super (the same super used to hold 4¼ sections) without follower, and spaced 1½ inches from center to center, you will have an extracting-super. True, you will have more frames to handle; but the uncapping-knife will easily reach clear across the frame, and you can pare off the cappings very rapidly; besides, two of these frames will go in the place of one L. frame, in an ordinary extractor. We offer these hives with one or two supers, as No. 8 and 9, at the same price as the No. 1E and No. 2E. If any prefer, they can use a hive from the bottom up, made up of shallow supers and frames, two of which count the same as one body. We do not, however, recommend this style of frame for brood-chamber, as they are not self-spacing, nor do we advise this plan.

AUGITE STOVE-MAT.



How much of domestic happiness is marred because the dishes prepared for dinner are scorched or burned! How annoying to have something boil over on the stove, as it is likely to do sometimes with the most vigilant watchfulness. All these troubles can be avoided by using the stove-mat shown herewith. We were somewhat skeptical about it till we tried it in our home, and now we are convinced that there is nothing that can lay a better claim to the term "a household necessity." The mat is made of asbestos, bound with sheet steel, crumpled around the edge, 9½ inches in diameter, and is indestructible. Though it is almost as soft as felt, it will not burn. You can place it directly on the blaze of a gasoline-stove, over the gas-jet, in the fireplace, or on the stove, and it will prevent burning of all kinds of food that ordinarily require stirring. No stirring is required for oatmeal, milk, rice, custards, blanc mange, jellies, butters, catsups, apple sauce, etc. In fact, nothing will burn on it. Coffee will not boil over if the pot is on the mat; bread toasts nicely on it. Try it and be convinced. For the nursery there is nothing equal to heat the milk and food for the baby. If a grate fire, lay the mat on the open fire. If the mat becomes soiled, do not wash or scrape, but turn the soiled part next to fire, and burn until clean. The mat regularly retails for 25 cts. We will furnish them at 20 cts. each; $2.00 per doz. By mail, 6 cts. each extra, or 65 cts. per doz. We will give one free postpaid for a new subscription to GLEANINGS, with your own renewal and $2.00.

SECOND-HAND FOUNDATION-MILLS.

We have the following list of second-hand foundation machines which have accumulated during the past few months, some in exchange for new machines, others from those who have decided to buy what foundation they use. We give as fair a description as we can of these machines, with the price at which we will sell. We can furnish samples from any of the machines to intending purchasers.

One 6-inch hex., No. N, used a short time in our wax-room; in good order; makes fdn. 10 or 11 feet to the lb. Price $10.00.

One 6-inch hex., No. M, extra-thin mill, in splendid order. Price $10.00.

One 6-inch hex., No. K, thin surplus mill, in good order. Price $9.00.

One 10-inch, round cell, No. L, in good order for light brood fdn. Price $14.00.

One 10-inch, round cell, No. I, for light or medium fdn.; in good order. Price $14.00.

One 10-inch, round cell, No. E, old-style frame; made some years ago, but used scarcely any, and in good order. Price $14.00.

One 10-inch, round cell, No. C, old-style frame; in fair order. Price $12.00.

One 12-inch, round cell, No. D, for heavy brood fdn.; roll, same size as 10-inch, only 2 inches longer; one of the original Washburn mills, in fair order. Price $15.00.

One 12-inch Dunham mill for heavy brood fdn.; not so good as the above, but in fair order; will sell for $12.00.

SECOND-HAND MACHINERY.

During the past few months we have bought up several outfits of machinery for making bee-keepers' supplies; and if any of our readers or their friends contemplate putting in machinery we are prepared to fit you out from cellar to garret with everything you need in engines, boilers, machinery, shafting, pulleys, hangers, belting, saws, etc. The following is a partial list of the second-hand machinery we have to sell. If you desire further particulars we shall be pleased to hear from you.

One 20-H. P. Fishkill horizontal engine, rebuilt, and as good as new; would cost new, $400; will sell for $200.

One 5-H. P. horizontal engine and boiler, with engine mounted on boiler, in good running order. Price $150.

One 24-inch two-roll Fay sandpaper machine, nearly new. Price, new, $450; will sell for $175.

One V-groove section machine, nearly new. This is our make, old style, with screw-feed; sold some years ago for $75; will sell now for $40.

One cutter-head, with table complete, for cutting entrances to sections. Old style, but nearly new, and in good repair. Price, new, $25.00; will sell for $15.00.

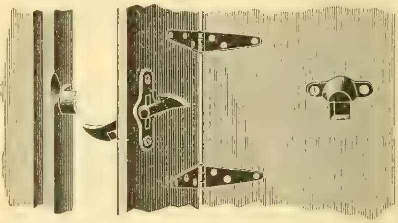
One double-head tenoning-machine, especially arranged for making the combined rabbet and miter joint of the Simplicity hive, but can be used for making sash and window-screen frames, etc. We could not build such a machine, and sell it for less than $150; we will sell this for $60.

Two extra large saw-tables for general use, to cut off or rip, with counter-shaft attached to frame; worth new, $50 each; will sell for $20 each.

Two four-piece section-machines, as good as new, they cost new, $85 each; we will sell them for $30 each.

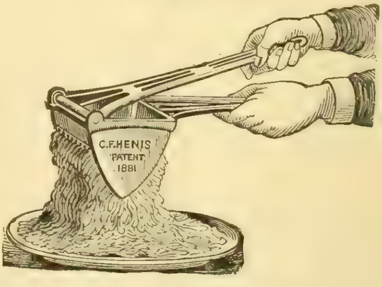
Also a large lot of shafting, pulleys, hanger belting, and saws, too numerous to mention here.

THE O. K. LATCH.



Stop that door from slamming. You can not do it more easily than by attaching one of the latches shown above. It will hold the door shut or open. It is intended for doors on all kinds of outbuildings, barn, stable, woodshed, honey-house, or any building that has a door that is liable to slam in the wind. The latch catches automatically either way when the door is opened or shut. It works so nicely that every one who sees it wants one. They are retailed from hardware stores at 25 cents each. They are made in this county, and we are allowed to make an introduction price of 15 cents each, $1.50 per dozen; by mail, 8c each extra.

HENIS' FRUIT-PRESS.



These are a very handy and useful instrument, not only for mashing potatoes, as shown in the cut, but especially for making fruit jams and jells. It is a press and strainer combined. It is likewise an excellent thing for pressing wax out of old combs when you melt them up. We have sold a great many of these in the past, but the manufacturers advanced the price, and they have not been selling so rapidly since. We laid in a good stock when the price was advancing, and the prices we have been offering are as low as the wholesale prices made by the manufacturer. To make them move off, now that they should be in demand, we offer the following prices: 30 cts. each. By mail, 50 cts.; 1 doz., by freight or express, $3.00; or a box of 3 doz. for $8.25.

ROOT'S GOODS FOR THE EAST.

Bee-Keepers of the East should

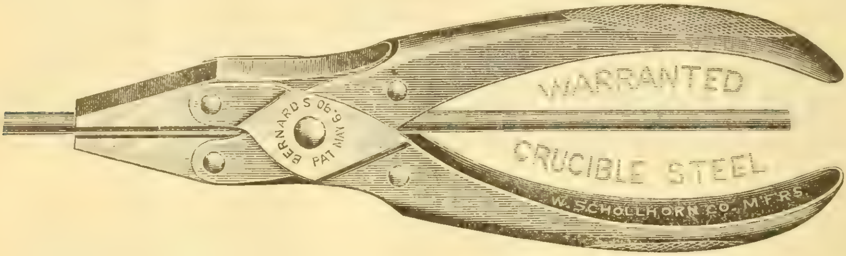
Bear In Mind that we have established at Syracuse an **Eastern Branch** where our Bee-keepers' Supplies are kept for sale, and prompt shipment. You can save time and freight by ordering from our Eastern Branch. We have engaged Mr. F. A. Salisbury to take charge of this business, and he will treat you well. He will be pleased to send you a list of goods kept in stock.

Address all orders.

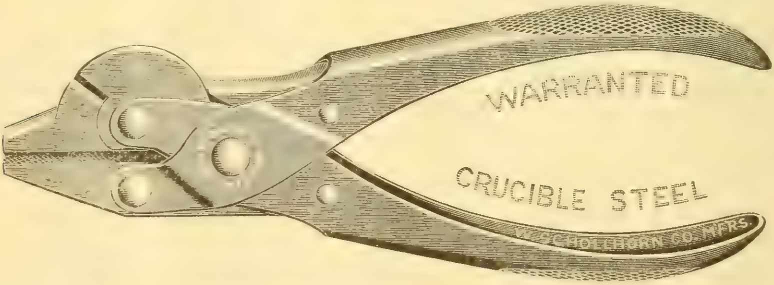
EASTERN BRANCH, F. A. SALISBURY, Agent, Syracuse, N. Y.

Bernard's Parallel-Jaw Crucible-Steel Pliers.

A year ago we called attention to some new pliers with parallel jaws, and their advantages over the old kind.



This cut shows the flat-nose plier and the way it works. You see that the jaws are not only parallel, but the throat is open, so that the article you grasp with them can be passed right through. By this means you can make them answer nicely as a wire-stretcher. We now have not only the flat-nose but also the round-nose, and the flat-nose with cutting attachment.



The advantages of these pliers over the ordinary ones are so obvious as hardly to need mentioning. They have a compound leverage 6 to 1, which, added to the advantage of the jaws being parallel, gives a powerful grip. The cutting-pliers will cut any thing you can get into them except hardened steel, such as steel springs and music wire. The compound leverage is so great that you will be surprised to see how easily they cut; but if you attempt to cut hardened steel you will ruin them. They are fully warranted; and, if injured in legitimate use, will be replaced by the manufacturers. For cutting wire they are away ahead of Button's or any other wire-cutting pliers made. As the cutters have a chisel edge, and on one side, you can drive a wire nail in to within ⅛ inch of the head, and then cut the head ff, which can not be done with Button's or similar iers. The smallest size will cut wire No. 13, and smaller; the medium size will cut No. 10, and smaller; and the large size will take wire up to No. 7, and cut it with ease. You can also trim off the end of a wire, and sharpen it like a wire nail. With a set of these pliers, in an extremity you could make wire staples or hog-rings out of nails; and there are times when the want of such articles is more than the pliers will cost. The jaws of the small size open $\frac{5}{16}$; of the middle size, $\frac{7}{16}$; and of the large size, $\frac{9}{16}$. The 3 sizes of each style are 4½, 5½, and 6½ inches long. They come rather high in price; but when compared with ordinary tools they are cheap. The manufacturers' name and address are stamped on every pair, and they are fully warranted. They are made by the Wm. Schollhorn Co., who have a wide reputation for their star brand of shears and scissors, and this is sufficient guarantee of their quality. We shall be pleased to supply them at the following prices; and as we buy them in gross lots we are able to make special prices to dealers who wish to keep them in stock.

	Length 4½	5½	6½
Flat-nose Bernard pliers, each	45c	60c	80c
Round-nose " " "	45c	60c	80c
Cutting " " "	70c	90c	$1.15
Postage extra, either style	04c	06c	08c

Please notice carefully the printed slip in the jaws of the cutting-pliers when you receive them.

CONVENTION NOTICES.

The National Bee-keepers' Association will meet at Washington, D. C., Dec. 27—29. See our editorial columns.

The bee-keepers of Eastern Iowa will meet at Maquoketa, in the City Hall, Dec. 14 and 15. F. **Coverdale**, Sec., Welton, Ia.

The eighteenth annual meeting of the Vermont Bee-keepers' Association will be held in the city of Burlington, Dec 28th and 29th, 1892. Every one interested in apiculture is earnestly desired to be present. As a bee-keepers' association we know no State lines, but will gladly welcome all that come, regardless of their residence Programs will be published soon, for which address H. W. Scott, 125 Brooklyn St., Barre, Vt.

The Ohio State Bee-keepers' annual convention will be held in the parlor rooms of the Cherry Hotel, Washington C. H., O., Dec. 27 and 28. Arrangements are made for 1⅓ railroad fare on all roads leading into Washington; viz., B. & O.; C., H. & D.; Panhandle, and Toledo & Ironton. Also reduced hotel rates.
Miss **Dema Bennett**, Sec., Bedford, O.

The Illinois State Bee-keepers' Association will meet at the Statehouse, Springfield, Dec. 14th and 15th Railroad rates have been secured on the certificate plan. Hotel rates have also been secured. We hope for a large attendance. The Illinois State Short-horn Breeders', Swine-breeders', and Sheep-breeders' Associations will meet the same week at the same place.
J. A. **Stone**, Sec., Bradfordton, Ill.

The Southwestern Wisconsin Bee-keepers' Association will hold its next annual meeting in Boscobel, Grant Co., Wis., on the 13th and 14th of January, 1893, commencing at 10 A.M. All members of the association are requested to be present, as the following officers are to be elected: President, vice-president, secretary, assistant secretary, and treasurer. Blank reports will be sent to each member of the association for 1892, with instructions. A cordial invitation is extended to all bee-keepers, and especially to those who would like to join us. Each member will be notified at least one month before said meeting. **Benj. E. Rice**, Sec.
Boscobel, Wis.

The 27th annual convention of the Michigan State Bee-keepers' Association will be held in the Senate Chamber, Lansing, on Tuesday and Wednesday, Dec. 13 and 14. The following is the program:

Morning session, Dec. 13.—Secretary's report of last meeting; appointing committees; reception of members; adjournment.

Afternoon session.—Annual address by Prest. R. L Taylor; Adulteration, H. D. Cutting; Shall we feed cane-sugar syrup for honey? W. Z. Hutchinson; Question-box; reception of members; adjournment.

Evening session.—Experiments in bee-keeping, Professor A. J. Cook; Has the bee-escape come to stay? S. M. West; Question-box; reception of members; adjournment.

Morning session, Dec. 14.—Few bees and much attention, versus many bees and little attention, B. L. Walker; Shall we go out of the bee business? T. F. Bingham; reception of members; adjournment.

Afternoon session.—Deciding on next place of meeting; election of officers; report of committees; financial report of secretary; How can we stimulate the market? Jas. Heddon; Carniolans, have they come to stay? E. R. Root; miscellaneous business; adjournment.

Reduced railroad rates can be had by applying at your ticket office. G. E. **Hilton**, Sec., Fremont, Mich.

KIND WORDS FROM OUR CUSTOMERS.

The queen with the one-frame nucleus arrived Saturday evening. I found all in good condition, which demonstrates that you have long-distance shipment of queens and bees down to perfection. The bees are as gentle as kittens, so I am well pleased. **Geo. W. Brodbeck.**
Los Angeles, Cal., Oct. 24.

THE NEW WATER CURE FOR CHOLERA.

Friend Root:—Thanks for the water-cure tracts. I will endeavor to place them where they will do the most good. Keith, of *Mother and Child*, now says Hall has accomplished much good by advising large injections. The cures of cholera cases in Europe by this simple process are sufficient to induce every intelligent person to save a physician's bill if taken in time. H. M. H.

Please accept my thanks for a package of "A new method of treating diseases without medicine." I was asking a noted physician of this city what he thought of the method. Strange to say, he had never heard of it. He himself was troubled with persistent constipation. I gave him one of your pamphlets. He became interested, and this morning informed me he thought it a good thing; in fact, had proven it in his own case. Verily the physicians can and do learn many important things from the laity. E. L. **Simmons.**
New York City, Oct. 31.

THE WHEEL OF 1892.

Friend Root:—I have just read your article in **Gleanings** of Nov. 15, on "The Wheel of 1892." I want to thank you for it. "Well," you say, "that's strange." Perhaps it is, but I am glad I read it all the same, for, while I have looked kindly on the advent of the wheel (for it has come to Phœnix quite numerously of late), and realized some of its usefulness, I had never thought of half the things in its favor until I read your article. Your comparison of the wheel as against the saloon as a demoralizing agent, together with your description of its practical usefulness, is so good that I wish every *intelligent* objector could read it; for then their objections would surely be no more. While I am a professing Christian, and often read your sermons, as I call your Home talks, and have been thinking after you, on the line of God's blessing, yet I had not thought of the Safety bicycle as one of God's special blessings until I read what you think about it, and I believe you are right; and I want to say right here, that I thank God for right-thinking men who give the public the benefit of their thoughts.
Phœnix, A. T. J. P. R. **Irvine.**

A KIND WORD INDEED.

Friend Root:—I have just found leisure to read the first column on page 3 of your illustrated catalogue and price list. I can tell you one great secret of your building up and holding such an immense trade. Years ago you acquired the name of dealing honestly, and it has stuck to you ever since. Every man who once buys of A. I. Root not only buys there again, but advises his bee-keeping friends to buy there, so that you have thousands upon thousands of men who are living advertisements of you every day in the week, including Sunday; and as long as you make everybody believe you are honest, and give them as good bargains as, or a little better than, they can get anywhere else, why should they not overwhelm you with orders? Without any intention of flattery, I can tell you that you have a reputation that you may well be proud of.
Marshalltown, Ia., Nov. 28. O. B. **Barrows.**

P. S.—I am associating with bee-keepers in the West, and therefore know what I am talking about. I know of one bee-keeper in the State of ——, and another in the State of ——, who have the reputation of being *confoundedly selfish*. O. B. B.

[My good friend, we are exceedingly obliged to you for the above, which is certainly extravagantly kind. There is also a grand moral to be gathered from your letter. It *does* pay to work hard, and to "suffer long and be kind," in your efforts to build up a business. I do not mean that we have done all you give us credit for doing, but we have certainly *tried* to do so. Your postscript also points another moral; and if I were to name the States you have mentioned in your letter, I presume a great part of our readers would readily guess at least the first letter of the two names, because these poor friends of ours have been so thoughtless as to let their selfishness and greed stand right out before the world. I mean this: They should have recognized beforehand that such business transactions would be terribly damaging to the reputation of any man who wants to get a reputation for being fair and square in business matters. I am well aware, too, good friend B., that everybody does not see even my poor self in the light you do. Some might think your closing words belong to me; and I have been afraid sometimes that they might belong to me just a little. On the other hand, there are those who, perhaps, have been pleased with their business deal with the two parties alluded to in your postscript. Let us try hard to "abstain from all appearance of evil."] A. I. R.

HONEY COLUMN.

CITY MARKETS.

NEW YORK.—*Honey.*—White comb honey is arriving in sufficient quantities to supply the demand, which is gradually slackening off. Fancy stock, 1-lb., sells at 15@16; 2-lb., 12@13. Fair white, 1-lb., 12@13; 2-lb., 11c. There is more buckwheat honey on the market than the demand requires, and it is necessary to shade prices in order to effect sales. We quote: 1-lb., glassed or in paper boxes, 10@10½; unglassed, 9@10; 2-lb., 9c. Extracted, clover and basswood, 8@8¼; buckwheat, 6@6½; Southern, 70@75 per gal. *Beeswax* dull at 25@26.

HILDRETH BROS. & SEGELKEN,
Nov. 26. 28 & 30 West Broadway, New York.

ALBANY.—*Honey.*—We have received up to date 3000 cases of comb honey and 217 packages of extracted. We believe the bulk of honey produced in this section has now been marketed. Prices are not quite as firm on buckwheat, but are well sustained on clover, which continues scarce. We quote: fancy white, 17; good white, 14@16; buckwheat, 10@11. Large sections 1c less. Extracted, light, 7½@8; dark, 6½@7.

CHAS. MCCULLOCH & CO.,
Nov. 12. 393-397 Broadway, Albany, N. Y.

BUFFALO.—*Honey.*—Honey market unchanged; prices remain firm, apparently with reasonably good prospects. Very fancy 1-lb. comb, mostly 15@16c; No. 2, 13@14; No. 3, 8@12. Buckwheat, 7@12. Very choice extracted, 7@8; common, 6@7. We still need a liberal supply for late winter trade. Would be glad to hear from any of those having it.

BATTERSON & CO.,
Nov. 19. 167, 169 Scott St., Buffalo, N. Y.

NEW YORK.—*Honey.*—Honey moving pretty lively, with good supply of buckwheat; clover not so plentiful. One-lb. fancy clover, 15@17; fair, 12@15; 2-lb. fancy, 13@14; 2-lb. fair, 11@12. Buckwheat, 1-lb., 10@11; 2-lb., 9. Extracted, clover, 8@10; buckwheat, 6@7; Southern, per gal., 68@75. *Beeswax*, 25@27.

CHAS. ISRAEL & BROS.,
Nov. 21. 110 Hudson St., New York.

NEW YORK.—*Honey.*—Fancy 1-lb. sections, clover, in good demand at 14@15. Buckwheat, 1-lb. sections, 10@11. Little demand for off grades. *Beeswax* is worth 26@26½, and there is not very much in the market.

THURBER-WHYLAND CO.,
Nov. 23. New York.

ALBANY.—*Honey.*—The honey-market is quiet and steady, with stocks light and crops nearly all on the market. White comb, 15@17; mixed, 13@14; dark, 10@11. Extracted, white, 8@8½; mixed, 7@7½; dark, 7. *Beeswax*, 27@28.

H. R. WRIGHT,
Nov. 21. 326, 328, 330 Broadway, Albany, N. Y.

MINNEAPOLIS.—*Honey.*—We quote market as follows: One-lb. sections, fancy white, 19@20; choice white, 17@18; choice dark, 14@15; common dark, 12@13c; California white, 16. Strained, in 10-lb. packages, 11; in kegs and barrels, 8@9½.

J. A. SHEA & CO.,
Nov. 22. 14 & 16 Hennepin Ave., Minneapolis, Minn.

CINCINNATI.—*Honey.*—There is a good demand for honey, with a scant supply of all kinds. Extracted brings 6@8c on arrival; comb honey sells at 14@16c in the jobbing way. *Beeswax* is in fair demand at 22@25c for good to choice yellow on arrival.

CHAS. F. MUTH & SON,
Nov. 21. Cincinnati, O.

DETROIT.—*Honey.*—Comb honey in fair demand at 13@14c, and for best white, 15 could be had. Supply not large. Extracted, 8@8½. *Beeswax*, 25@26.

Nov. 21. M. H. HUNT, Bell Branch, Mich.

CLEVELAND.—*Honey.*—Honey is being bought at 15@16 for No. 1 white; No. 2 grades, 12@14, F. O. B. at shipping points. *Beeswax*, 18@20. Honey more lively than last week.

REYNOLDS & WILLIAMS,
Nov. 19. 80 & 82 Broadway, Cleveland, O.

KANSAS CITY.—*Honey.*—Demand good, supply large. White 1-lb., 17c. Extracted, 6@8.—*Beeswax.*—None on market.

HAMBLIN & BEARSS,
Nov. 22. 514 Walnut St., Kansas City, Mo.

BOSTON.—*Honey.*—Comb honey is selling a little slow. Prices, best 1-lb., 17@18. Extracted is selling well from 8@9.—*Beeswax.*—None on hand.

BLAKE & RIPLEY,
Nov. 22. Boston, Mass.

CHICAGO.—*Honey.*—There is little change in this market. Stocks are larger than they have been at any previous time this season. Best white brings 18c. Extracted, 6@9c. *Beeswax*, 25c.

R. A. BURNETT,
Nov. 19. 161 So. Water St., Chicago, Ill

KANSAS CITY.—*Honey.*—We quote: Comb, No. 1 white, 1-lb. comb, 17@18; amber, 15@16; dark, 10@12. Extracted, white, 7@7½; amber, 5@6. *Beeswax*, 20@25.

CLEMONS-MASON COM. CO.,
Nov. 23. Kansas City, Mo.

ST. LOUIS.—*Honey.*—Demand continues good for extracted at 5⅛@6¼ in barrels. Comb is steady at 10@16. *Beeswax*, prime, 24¼.

D. G. TUTT GROCER CO.,
Nov. 21. St. Louis, Mo.

SAN FRANCISCO.—*Honey.*—Extracted nearly all sold, and held at 7@7¾. Comb honey scarce at 12@13. *Beeswax*, 25@27.

SCHACHT, LEMCKE & STEINER,
Nov. 23. San Francisco, Cal.

FOR SALE.—Extracted honey at 8c per lb.
M. ISBELL, Norwich, Chenango Co., N. Y.

WANTED.—White comb honey in one-pound sections.
J. T. CARSON & CO.,
325 W. Main St., Louisville, Ky.

FOR SALE.—10 barrels choice white-clover honey. Will put it up in almost any style of package desired. Price on application. 20tfdb
EMIL J. BAXTER, Nauvoo, Hancock Co., Ill.

WANTED.—You to know Lintless Cotton yields from 200 to 400 bushels of seed to the acre, on *rich* land. It is just what is claimed for it. How can it be a humbug? $1.00 per pkg.; each pkg. contains 1 qt.
R. H. CAMPBELL, Madison, Morgan Co., Ga.

Queens From Best of Stock By Doolittle's Method **1893**
11tfdb J. B. CASE, Port Orange, Fla.

ROOT'S DOVETAILED HIVES and BEE SUPPLIES FOR SALE
W. K. BALL,
Box 483, Reno, Nevada.

FOR SALE.—One light power mandrel; 2 eight-inch saws; one cutter-head, ⅞ of an inch wide; also a number of eight-frame hives, some new, and some second-hand. Will sell cheap.
WILLIAMS BROS., Burdick, Ind.

WANTED.—Farmers in the cotton States to know that lintless cotton is now the biggest discovery in America. Lintless cotton yields nothing but lintless cotton seed, and is a very valuable plant in this age of cotton-seed-oil mills. Price from Nov. 1, $1.00 per pkg., one quart in each pkg.
R. H. CAMPBELL, Madison, Morgan Co., Ga.

Wants or Exchange Department.

WANTED.—To exchange Scotch Collie pups for any thing useful on farm or in bee-yard.
15tfdb N. A. KNAPP, Rochester, Lorain Co., O.

WANTED.—To exchange 20 acres fine land, adjoining Garden City, Kansas. All under irrigation; 10 acres in alfalfa, 10 in garden, for cash, San Diego, Cal., city or country property, or offers.
H. L. GRAHAM, 850 6th St., San Diego, Cal.

The Bee-Keeper's **Review** For Nov. contains illustrated articles from B. Taylor and G. M. Doolittle on cellar construction. Dr. Miller defends sub-earth ventilation Prof. Cook has an article entitled "What is Honey?" in which views are expressed that may be a surprise to some bee-keepers. R. L. Taylor shows when and where feeding may be made very profitable. The bee and honey show at the Detroit Exposition is described by the editor and illustrated by cuts made from flash-light photos. Send ten cents for this number, and with it will be sent copies of two other issues, also a sheet upon which are printed nearly a dozen portraits of the **Review's** principal correspondents (among them the editor), together with a list of all the special topics that have been discussed, the numbers in which they may be found and the prices at which they will be sent. A proposition is also made whereby these back numbers may be secured at HALF-PRICE. Price of the **Review**, $1.00 a year. The **Review** one year and **Advanced Bee-Culture** for $1.25. New subscribers for 1893 get the rest of this year free.

STRAY STRAWS

FROM DR. C. C. MILLER.

Finished cellaring my bees Nov. 16.

That sugar-honey discussion, I'm a little afraid, will be easier started than stopped.

What a comfort to know the bees are all snug and warm when the wind howls freezing cold!

Illinois bee-keepers have asked the State for at least $1000 to make a display at the big show next year.

Don't breed from a queen whose colony died in wintering, is advice I lately received. I don't believe I would.

Nancy Hanks' owner thinks it quite important that horses should have earth to eat, in order to have good digestion.

That Iowa man at Atlantic has a scheme that he is quietly pushing by which he may come in a length ahead of government in introducing *Apis dorsata*. Success to him!

The longest evenings are now here, and it's a good time for the younger members of the fraternity to do a lot of reading-up. No danger but the veterans will read all they can get hold of.

My wife says I must hereafter label all my "Straws" thus: "This is a joke," or, "This is sober earnest," since one man understands as "sarcasm" what I meant as honest commendation.

I hope Doolittle will not be discouraged from telling of his downfalls because so many are ready to tell him how to introduce queens. I always like to see him down, as it's such fun to see him get up again.

Allen Pringle has been appointed Superintendent of the Canadian Apiarian Department at the World's Fair. He's the kind of man that rolls up his sleeves and goes to work when he has any thing to do.

Squashes are usually kept in cellars. *American Gardening* says that is the very worst place. Keep them in a *dry* place where the thermometer never goes below 50°. As well try to keep a cracked egg as a squash that is cracked or bruised.

To preserve combs from the ravages of worms, it is quite important to keep them spread well apart through the summer, and it is also important in winter where there are mice. Leave an inch or two of space between them and they are not so convenient for nesting, neither will the midrib be so likely to be dug through.

Following the bad example of the *A. B. J.*, the *C. B. J.* has been calling me names too. After being lashed into a fury by reading "stray-sawing, sway-stawing, stay-strawing, straw-swaying," my jaws cramped so I couldn't read the rest.

That young man that's steering the good old *A. B. J.* is trying to start a quarrel between Mrs. Atchley and me by saying one can use a typewriter better than the other. But he can't make a break between two such old cronies as we are, can he, Jennie?

Illinois has set a good example to other States. The Illinois State Association resolved to ask that some of the $15,000 appropriated to each State by the Hatch Act should be used for the benefit of bee-keepers, with J. A. Green to look out for their interests. A good move and a good man.

Why do bees "rake"? is thus answered by I. W. Wykoff: "They are getting wood to make a kind of paper to seal their brood. They work mostly on the inside of the hive. The cocoons in the cells are made the same way." I think a hive would be moth-proof if the inside were all metal, so they could get no wood to weave a cocoon.

Whitewash for hives.—Dr. Tufts, in *American Bee-keeper*, says he prefers whitewash to paint for hives. Eighty cents buys material for 120 hives, preserves the wood, and in Louisiana, where it is important to keep hives dazzling white on account of the hot sun, he finds he can do it better and easier with whitewash than with paint.

Fooled again! My bees were in good shape to go into the cellar the last of October, but I thought nice weather would last awhile. Instead of that the thermometer went down to 19, then to 15, and, as soon as a day came when a few bees flew, I got them in cellar. It looks now like settled cold weather, and I don't know of any thing gained by their being out since the last of October.

Keep up with *the times* by taking a good bee-paper, **Gleanings** for instance. But you can't keep up unless you first catch up, and you'll make rather limping work trying to catch up by means of periodicals. The way to catch up is to get a good text-book like the A B C, master it, and *then* with a good bee-paper you can keep up with the procession without being all out of wind.

A novel method of introducing queens is given by John Poindexter, in *A. B. J.* When he has a troublesome colony that kills every queen given, he gives them a good smoking, raps on the hive a few minutes, smokes the queen in at the entrance, closes up the hive, loads quickly on the wagon, and drives seven miles to his other apiary, keeping bees confined till after dark. Succeeds every time. Wouldn't it do as well to have a small boy pound on the hive as long as it would be in going seven miles?

In wintering, Hasty says in *American Bee-keeper* that "a cluster formed touching the top, and stores below them, is very much safer than a cluster formed away down, and stores above them." His idea is, that moisture will collect on the stores above and drench the bees. I believe in lots of stores, but Hasty's argument looks rather against it. On the other hand, the bees insist on storing above instead of below.

A smoker without a cut-off blast is spoiled by smoke getting into the bellows, and with the cut-off the blast is weakened. For a long time I have said that a valve should stop the air from returning through the blast-tube of the Clark smoker into the bellows, but the manufacturers said it couldn't be done. The Crane smoker is certainly *aimed* in the right direction. After I've tried it a season I can tell whether it has hit the mark aimed at.

LANGSTROTH'S REMINISCENCES.

UNRULY STUDENTS; MARRIAGE.

The faculty had been annoyed for some time by students, whose class had been earlier dismissed, coming slyly to the door of a recitation room and thundering upon it with a heavy stick of wood. If the tutor went to the door, of course the culprit decamped; and the laugh which followed an unsuccessful attempt to catch him was often quite mortifying. The annoyance at last became so great that the faculty passed a resolution that the first student detected in the act should be dismissed in disgrace from the college. One morning after dismissing my division I found that I had left behind me the book in which I marked the standing of the students. Returning to get it, as I opened the door into the hall I saw a student battering with all his might upon an adjoining door. As soon as he caught sight of me he ran through the hall into the open air. Instead of pursuing him I left the building in the opposite direction; and as I entered the hall of one of the dormitories, through which I thought he might be coming, he did not notice me until he was fairly brought to a stand by running right into my arms. Imagine his consternation! Calling him by name, I said, "———, is that you?"

"Yes, sir," was the reply.

"Then you can come to my room after breakfast."

He came; and as I addressed him he looked as though his fate was sealed, but that he must try to brave it out as well as he could. He was a young man of good ability and generous impulses, but he had fallen under bad influences, and was rapidly losing his standing for scholarship. His father had written to me several times, with deep anxiety, and I had done all that I could to save his boy. My heart was moved at the sight of him, and I said, "You know the resolution passed by the faculty concerning this offense?"

"I do, sir."

"You know that duty may compel me to report your case?"

He assented.

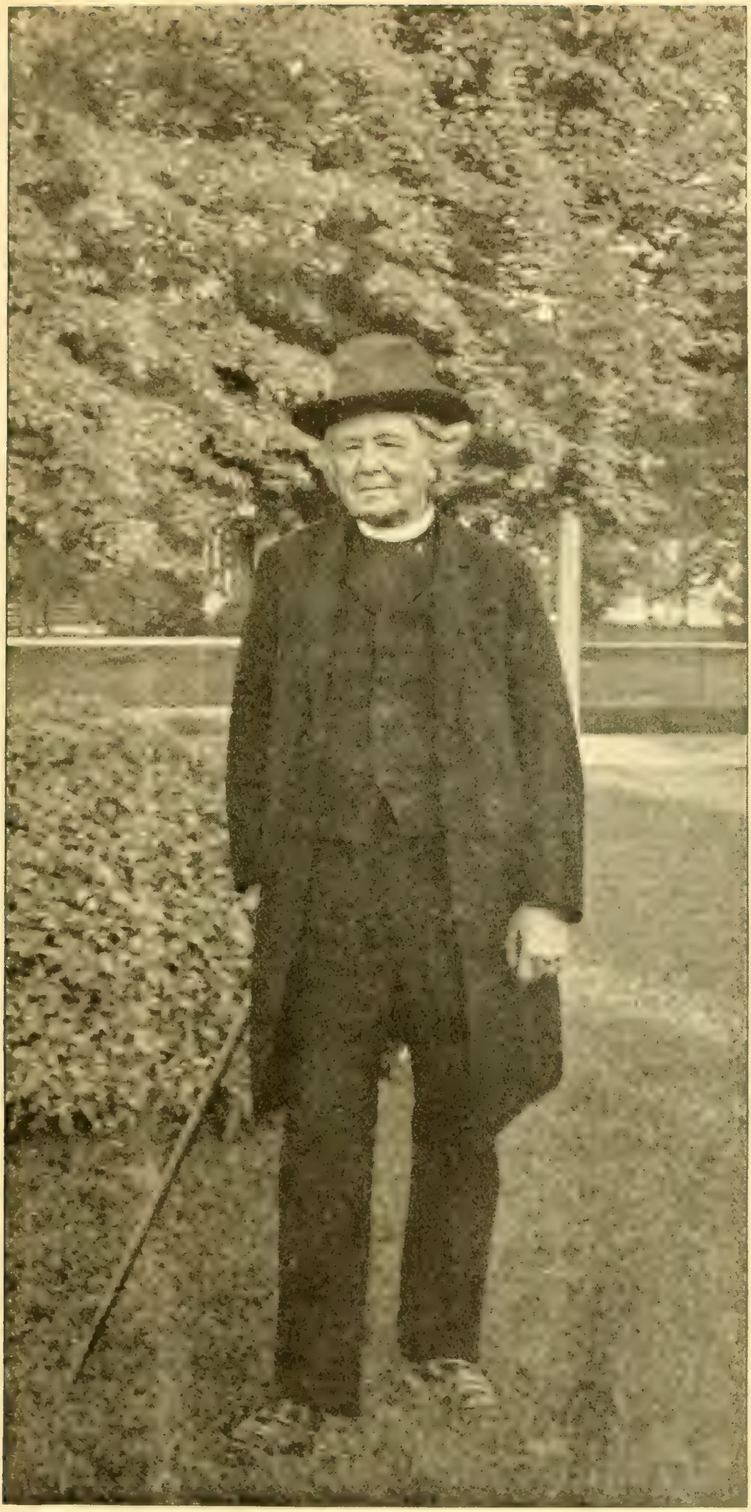
"Now, I can not bear to do it. Here are the letters which I have received from your anxious father. I want, if possible, to save you; and if you will give me your word of honor that you will try, from this time, to do your duty, I will never say a word to any one about the event of this morning."

He burst into tears, grasped my hand, and, with every appearance of sincerity, gave me the promise; and he kept it. Some years after, at a meeting of his class on commencement week, I was invited, with some other of the tutors, to dine with them. After dinner this young man related these facts, saying, "When I went to Tutor Langstroth's room I was desperate; for I felt that I should be dismissed, and that the disgrace would almost break my good father's heart. Probably, if the letter of the law had been carried out, I should have been ruined; but the kindness of Tutor Langstroth, his moving appeals, and the generous confidence which he gave me, melted my heart, and, under God, he saved me."

I will venture to give my readers a very short story of love and courtship. One of the young ladies' schools in New Haven, where I taught, was under the care of Mrs. Harriet Tucker, her chief assistants being her daughters. From my first acquaintance with this family, the second daughter, Miss Anna, possessed for me peculiar attractions. One day she brought me an algebraic problem for which she could find no solution; indeed, that problem had been sent by an instructor in some college, to Pres. Day, as one which could not be solved under his required conditions. I furnished her with several solutions which fulfilled these conditions. Being like myself of a mathematical turn, I gave her ingenious solutions of other problems. One thing led to another, and I eventually found that the arrow of the god of love could be tipped quite effectively, even with a mathematical point; so that I afterward used to say, laughingly, that I won my wife by mathematics.

EXPERIENCE IN THE MINISTRY.

During my tutorship my health was far from being strong, and I performed my college duties and pursued my theological studies under great drawbacks. I occasionally suffered from my head trouble, but never fell under its complete control. In the winter college vacation I preached as a candidate two Sabbaths in Andover, Mass., and received an almost unanimous call to become pastor of the Old South church and congregation. It had become considerably divided in trying to settle a pastor, and its leading deacons strongly urged me to accept the call, my theological teachers also advising the same. In following this advice I probably made one of the great mistakes of my life. Some 500 names were enrolled on the church catalogue; my health was poor, and the duties of a minister in such a large parish were very arduous. One of my first pastoral visits to the sick called me about four miles from home in the morning, and another visit the same day called me in the afternoon as far in an opposite direction. As the Theological Seminary was situated in the bounds of the parish, and many of its pupils were teachers in its Sabbath-school, it was obvious that a young man in poor health, and with very few written sermons ahead, would find his position as pastor of such a prominent church an unusually difficult one. The more I reflected on the great responsibilities which I was about to assume, the more I felt that the experiment was very hazardous, and I ought to have listened to the monitor within. If I had accepted a smaller charge, it would have been far better. I was settled over this large parish in May, 1836, and was married to my beloved wife, Miss Anna M. Tucker, Aug. 22 of the same year. I had an affectionate people who treated me with great consideration, were willing that I should exchange pulpits quite frequently with neighboring minis-



L. L. LANGSTROTH, PHOTOGRAPHED BY REYNOLDS, DAYTON, OHIO. SEE P. 897.

ters, or have the professors in the seminary often occupy my place. Still, the necessary work was evidently beyond my strength. At that time few of our Congregational ministers preached without a written manuscript. About half of my time I took only notes into the pulpit. Years after I left Andover, some, who had heard me extemporize while they were theological students, reminded me of the pleasant but novel experience it was to them to hear a preacher who did not read his sermons.

My congregation was famous for aged persons, and I often recall the venerable array of white-haired men at the heads of the pews. The widow of a Revolutionary soldier, almost one hundred years old, soon sent for the new minister to pray with her, although she was so deaf that she had not for years been able to hear a prayer. I always had an unusually strong and clear voice; so I thought I would try the experiment of making this aged woman hear a few words of prayer. Kneeling beside her chair, as close to her ear as possible, I prayed very slowly, but in as loud and emphatic a tone as I possibly could. Rising from my knees, after a short prayer, I saw tears rolling down her furrowed cheeks as she exclaimed, "O dear Lord! I have heard a prayer again! I never expected to hear another prayer, but I heard every word that you said, and you did not *scream* at me either!" After this it was thought that the new minister could almost make the deaf hear; but he could not.

Dayton, O. L. L. Langstroth.

Continued.

THE SUGAR-HONEY DISCUSSION.

THE REAL POSITION OF THE BEE-KEEPERS' REVIEW; BY W. Z. HUTCHINSON.

Readers and correspondents of the bee-journals have little to complain of in regard to the unfairness of the way in which the journals treat them or the subjects that come up for discussion. I think that nearly all of them, if not all of them, are fair in this respect—they are willing that all should have a hearing; and for this reason I feel sure that Gleanings will allow me to define my position on the sugar-honey matter. The main reason why I desire to make this explanation is, that almost every one seems disposed to jump to the conclusion that I am advising fraud.

When that first article came from friend Hasty, I think that I felt very much as some of the brethren do now. I thought, "Why, Hasty is advising adulteration." I did not see how I could publish it. I sat down to argue the case with my erring brother. To my surprise, I could not combat his views. (They yet remain unanswered.) The gist of his argument was that bees do *make* honey; that nectar, even though evaporated to the consistency of honey, would not be *honey;* that nectar is almost wholly cane sugar which the secretions of the bees change to glucose or honey. This being the case, he argued that it mattered not where the bees secured their cane sugar, as the product would be honey. This appeared reasonable, and I remembered that, when feeding honey for winter stores, I had often tasted of the product and thought that, unless I knew its source, I should have pronounced it honey. It had always been the policy of the *Review* to allow any one to be heard, even though his views were not orthodox. I remembered, too, that many of our blessings come in disguise, and, not being recognized at first, they are often opposed. I knew, of course, that the idea of feeding sugar to make honey was not new, but that it really became *honey* was new. Heretofore it had been called adulteration. I expected that the article would call forth severe criticism, but was surprised at the turn affairs took. Almost every one seemed to miss the true spirit of the article, and the cry of fraud was raised when there had not been the least intimation that the product was to be sold for any thing else then what it really was. This hurt my feelings more than I can tell. I was willing to admit that I might be lacking in judgment; but to be accused of upholding fraud, when that was furthest from my intention, was hard to bear.

The article was published. Later I gave the criticisms that were received. Then I was still further surprised to see others come to my defense. A wordy war seemed about to follow. I asked my readers whether it would be best to allow it to go on, and some good friends of mine plead so earnestly that it be stopped that I cut off the discussion, temporarily at least, even though many wished it continued.

It soon bobbed up serenely again, however, in the shape of articles from Prof. Cook, showing that even chemists, students, and *Cooks* could not distinguish sugar honey from the best clover and basswood. It seemed to me that it would be a good time to decide upon what honey really is, and I asked Prof. Cook to write an article headed "What is Honey?" It appeared in the Oct. *Review*, and, to my surprise, it was actually a defense of the Hasty view of the matter. The subject was again fairly started, and it seemed better to allow it to go on and have some kind of a decision arrived at than to try to smother it and have it bursting out in unexpected places. I wish that all who are interested in the matter could have the November *Review* and read the views of Hasty, Doolittle, R. L. Taylor, Dr. Miller, and others on this knotty question. Don't think that the arguments are all on one side, for both sides are very fairly represented.

Some seem to think that the editor of the *Review* is advocating the feeding of sugar to produce honey to be sold as floral honey. Neither he nor any of his correspondents have advised such a course. The editor has never advised the raising of sugar honey except as an experiment. All that he has advised aside from this is, in view of the assertions of such men as Messrs. Cook and Hasty, that the matter shall receive discussion and experimentation. It seems as though most of the writers wish the question decided *without* discussion. Is this wise? Remember that "he who can not reason is a fool; he who dare not is a coward; he who will not is a bigot."

The *Review* has no pet implement, race of bees, nor theory, to puff or boom. It tries honestly to find out which is best, and then make known the fact. In a line running across its title-page may be seen the following: "Devoted to the Interests of Honey-producers." To the best of my ability I am making the *Review* what it claims to be. The editor of Gleanings writes as though the *Review* were advocating the raising and sale of sugar honey. As I have already said, it is simply trying to find whether such a course is *advisable.* A correspondent wrote me a few days ago, "The *American Bee Journal* and Gleanings are here, and I see they contain not a word about sugar honey. Silence is one step more favorable than opposition; but it strikes me that silence on a redhot subject is not the way for a leading journal to remain a leading journal." Gleanings is certainly a leading journal, and it has now taken up the subject; but it says that it has done so only that it might oppose the *Review*, which it considers is taking a wrong course. The *Review* has no other object than to arrive at the truth.

I believe that GLEANINGS has the same object. Now let GLEANINGS show to the *Review* that the production and sale of sugar honey will be to the disadvantage of bee-keepers, and see how quickly the *Review* will oppose the practice. It desires most sincerely to work for the good of bee-keepers, and it will not work in the wrong direction after its errors are pointed out.

Mr. A. I. Root says that the practice of raising sugar honey is not new; that it has been tried before many times, and abandoned. He also asks why it has not been produced in times of scarcity. There are three reasons: First, it has heretofore been looked upon as adulteration; second, the price of sugar has been so high that it would not be profitable; third, bee-keepers have not had sufficient practice to enable them to manage the business in a successful manner. For instance, Mr. Root tells of his non success in feeding a barrel of sugar to *one colony*. I could not repress a smile as I read it. Almost one of the first things that I learned in feeding back was that bees, after being fed awhile, become fat and lazy, so to speak. They secreted large quantities of wax, but were of little value as storers of honey from the feeder. This matter of feeding back for the production of comb honey is really a distinct branch of bee-keeping, and one that must be learned before it can be successfully followed.

Some have objected to the raising of sugar honey on the ground that it will lower the price of honey. All seem to forget that the cost of sugar honey will always be that of floral honey plus the cost of the sugar and the trouble and expense of feeding. In the experiment that I made the present season, the $7.50 was only the cost of the sugar, a fact that the editor seemed to have overlooked. I might say, still farther, that the feeding was done after the flow from clover and basswood was past and the bees were hanging in masses on the outside of the hives. No honey was coming in. The greatest care was needed to prevent robbing. It may be questioned whether there would be sufficient profit in raising sugar honey to warrant its production. It is a fair question, and it was to settle just such questions that the discussion was started; but some say that even *discussion* is not advisable. Please show us why, and we will immediately drop it.

It may not be out of place here to call to mind the time when the editor of GLEANINGS advised the use of grape sugar for stimulative feeding. Public opinion was opposed to its use, and Mr. Root was obliged to give it up, although he believed that he was in the right. I defended him at the time, and used a barrel of the sugar, and would use it now if it were not that cane sugar is cheaper for that purpose. It may be that, while I believe that the course that I am now pursuing is right, public opinion may be so opposed to it that I shall be obliged to keep quiet on the subject; but there is one consolation—the truth and right will *eventually* prevail.

I can not more appropriately close than by thanking Ernest R. Root for his generous words in defense of my honor and integrity. They warmed my heart in a way that it has not been warmed in months. W. Z. HUTCHINSON.

Flint, Mich., Nov. 19.

[We are very glad to get this article as it shows more clearly Mr. Hutchinson's position; *i. e.*, that he did not intend that sugar comb honey should be sold as floral honey. We should have preferred to omit any footnote in reply; but as Mr. H. asks one or two questions we will try to make ourselves more clearly understood. We believe that the advocacy of sugar comb honey is ill advised—not because honest bee-keepers will make a bad use of the knowledge, but that their middle men customers, less scrupulous, perhaps, seeing that the honey is beautiful in appearance, would be sorely tempted to sell it as floral honey, and some would surely do it. If the transactions were between the bee-keeper and the consumer direct, and if we could be sure that the bee-keeper too were as conscientious as is friend Hutchinson, we would raise no objection. Right here we can not do better than to make a short extract from a private letter. The writer, whose name we withhold, says:

> It seems to me very unfortunate just at this time, when we are considering the best way to fight the adulteration of honey, that this subject of feeding sugar for honey should be brought up and almost indorsed by some of the leading bee-keepers of the land. It is a great pity, it seems to me, that any one should be so unwise as to inflict a discussion of sugar honey on us at this time.

To sum it all up, then, in a word, it is the fear of consequences that may result from such a discussion: First, the use that secular newspapers may make of it; second, the use that dishonest dealers may make of sugar-fed honey produced by honest bee-keepers.

The strength of Prof. Cook's position, and, in fact, Mr. Hutchinson's also, seems to be in the assumption that sugar-fed syrup when stored in the combs *is honey*. Prof. Cook may be right; but as good an authority as Thomas Wm. Cowan, of England, editor of the *British Bee Journal*, a scientist of the front rank, Chas. Dadant, and others, disagree quite emphatically with him, and as yet we can not regard the experiments made by Prof. Cook as being conclusive.

We had concluded that we would insert no more articles, either pro or con, on the subject; but among those we have received protesting against sugar honey is one from Mr. Herman F. Moore, attorney-at-law, Chicago. In former years Mr. Moore sold tons and tons of honey in some of our large cities, directly to consumers; in fact, we know of no one who has had more experience in selling honey to consumers direct, in large cities, than our friend Mr. Moore. He writes as follows:

> *Friend Root:*—I have been reading with some interest and some indignation the articles in recent numbers of some of the bee-journals on feeding sugar to make honey, and selling the product to the public as honey, or as what it really is, sugar syrup in combs. I do not believe that friend Hutchinson, with all his liberality in regard to enlarging the sphere of the bee keeper's activity and profits, would be willing also to justify any amount of lying or deception that would be necessary to sell his product. But this is, without any doubt, the logical result of such reasoning. Cotton-wool, lard-butter, wood nutmegs, sugar-honey, are, in their *very* name, a *lie*, and in their relation to the commercial world they are a fraud. Dealers in frauds *must* lie. Instance the hundreds of fraudulent shortlived schemes developed constantly to catch the unwary. The great public, and the individuals who compose it, are not perfect, by any means; but they demand now, more than ever before, honorable and true dealing in all things, and condemn for ever all who fall short. To illustrate, I ask one of my thousand customers, "Do you wish half a dozen quarts of honey on my next trip?"
>
> "Is it pure?"
> "Yes, sir." (Lie No. 1.)
> "What kind of honey is it?"
> "White-clover honey, sir." (Lie No. 2.)
> "Is this new honey?"
> "Yes, sir." (Lie No. 3.)
> "Is it real bee-honey?"
> "Yes, sir." (Lie No. 4.)
> "Do you feed sugar to your bees?"
> "No, sir." (Lie No. 5.)
> "Did you ever know of any one who did?"
> "No, sir." (Lie No. 6.)
> "How do you know this is pure honey?"
> "My own bees gathered it." (Lie No. 7.)

And so on indefinitely. All these questions, and many more, will be asked by the public in their effort to avoid getting something spurious. But suppose we wish to be honest with our trade, and tell the truth at all cost. We then converse thus:

"Mr. Smith, on my next trip I will deliver to any of my customers who desire it some nice sugar-syrup honey."

"What is that?"

"Oh! I have a new method of making honey now on *my* farm. I mix up a barrel of nice granulated sugar, A1 quality, with water, in a boiler; and, when dissolved and cool, I feed it to my 100 colonies of bees, and they build beautiful white combs, just like this, and fill them with the nice clear sugar syrup, and cap it over nicely, so you could not tell but the bees had gathered it from field flowers."

"I don't think I should like it to eat on my table, sir; but as I have bought of you for some years, and was always pleased, I'll try some; what are you going to ask for it?"

"Twenty-four cents a pound, sir, and that is cheap for such pretty white combs in 1-lb. sections."

"How much a pound did you pay for the sugar you fed your bees?"

"Oh! that has nothing at all to do with it, sir; the time of the bees is very valuable, and they really change it into honey in putting it into the combs. I buy the sugar cheap in large quantities, 4½ cts. per lb., but it costs lots to get it into the combs, and it costs lots to deliver it to my customers."

"Well, sir, I am sorry; but I will buy me 10 lbs. of granulated sugar in the morning for 50 cts., and add 5 lbs. of water, and make 15 lbs. of honey just as good as yours. By this I shall save the difference between 50 cts. and $3.60—a saving of $3.10 on 15 lbs. of honey; and my wife can make up enough on Saturday to last a week."

Here is another customer. "How d' do, Mr. Jones? Don't you want some of my nice sugar-syrup honey?"

"*Sugar! Syrup! Honey!* Get out of my store, you miserable cheat!"

"Why, Mr. Jones, didn't I always sell you nice honey?"

"No, sir. That first lot was nice—they always bring the first lot nice; it was white and clear, just like pure honey, but that next lot was brown, and tasted different. You told me there was a difference in honey, and I almost believed, bein's you was a pleasant feller, and spoke fair; but now I know it was a lie, for I allers knew all honey was alike; and you dare to offer me sugar-syrup honey! There's the door, and never come in here again. Git!"

There is great objection, in my opinion, to the use of the terms "digested nectar." "Digested" means "separated into nutritive and innutritious elements"—Webster. Any other meaning is unusual and rare. The use of this term in relation to honey would seem to indicate that the honey was swallowed by the bees, subjected to the action and juices of their digestive organs, and then —— up into the wax cells to be used as human food.

With all respect to our chemists, and in view of the serious mistakes they have at times made in essential matters, I am of the opinion that evaporation is the only chemical change honey undergoes in the cold or elsewhere. I should be glad to know the result of more searching investigation along this line.

The question of suppressing discussion and muzzling the public press is one that comes up at all times and in all lands. In our own free America (the best country on earth) this question has been settled in favor of absolute freedom, without regard to the injury it may do a particular person or class. The only remedy seems to be a suit for damages against the offending party; and, however much we as bee-keepers may deprecate any discussion in our bee-journals that may put our business in a bad light before the public, we have no remedy but this. Let each one who writes be sincere, and keep the best interests of bee-keepers at large in view, and deal with the public in a truthful, straightforward manner, not indicating that we have any skeletons to hide in dark closets. To the public, the fact of having a secret is of itself a suspicious circumstance, for it knows that right and truth need not fear the light. HERMAN F. MOORE.

Chicago, Ill., Nov. 21.

And another writes, whose name we are also at liberty to give, as follows:

Mr. Root:—Your notes on the sugar-honey question, p. 834, are right to the point. It is too bad for such men as Hutchinson, Cook, and others among the headlights, to even speak in favor of sugar honey, even *if* it were a fact that such might be made.

East Constable, N. Y. H. P. LANGDON.

As some of the criticisms may *seem* a little harsh, though not intended to be so, it were no more than fair that Prof. Cook and Mr. Hutchinson have an opportunity to reply if they so desire; after which we think it would be better to close the discussion.]

WINTER PASSAGEWAYS.

DOOLITTLE BELIEVES THAT WINTER PASSAGEWAYS ARE OF NO MATERIAL BENEFIT; CAUSE OF BEES DYING AWAY FROM THE CLUSTER.

A correspondent writes that he thinks that much of the loss of bees in winter comes from "chill, or the impression of cold on the bees occupying the outer ranges of comb during sudden changes from warm to very cold weather. Especially is the loss very considerable from this source where the comb passages are deficient, as in such case the detached clusters are unable readily to join the main cluster, and are not in sufficient numbers to maintain the requisite degree of heat, hence are lost. What is your opinion in this matter?"

In the above our correspondent brings up a subject which was discussed at length several years ago, when there was a "craze," as it were, for "winter passageways" through the combs. The argument then brought forth was, that, on the first cold spell, the cluster of bees was obliged to contract in order to maintain the necessary heat required; and in doing so, those occupying the outer ranges of comb, being in a sluggish state from the influence of the cold, failed to pass up and around the combs quick enough to keep up with the receding cluster, hence were left to perish with the cold. To obviate this loss, winter passageways were recommended through the center of the combs, made by boring holes through them, or by having a curled shaving suspended in each frame when the swarm was hived, so that the bees would of themselves leave such passageways when constructing comb. By this means the outer bees had direct communication with the cluster or main body of bees in the center of the hive, so that, even though partly stiffened with cold, they could easily recede so as to keep up with the main cluster. As the bees would, as a rule, fill up these passageways each summer, it was found to be quite a job to make them each fall, when some one proposed boring a hole in the side of the hive at the proper place, when, with a square stick, pointed at the end, which was to be slowly "wormed" (so as not to kill the bees) through to the opposite side of the hive, and thus make a passage through all the combs at once, thus making quite a saving of labor. Where such passageways are desired, probably there is no better way of securing them than this last, as the holes in all of my older hives testify that I used it on a large scale in the past, so I should know something about it. However, it was soon found that the bees would remain and die within half an inch of these holes in the combs; and as said holes were quite a damage to the combs (the bees filling them with comb of the drone size the next season), the practice of making such passageways has been generally given up, I believe. Some who still cling to the idea use what is known as the "Hill device" above the combs, as a sort of compromise, which is better, if any thing must be used; but after careful experiments with the above, the writer has discarded the whole of them, believing there is not enough gained to compensate for the trouble.

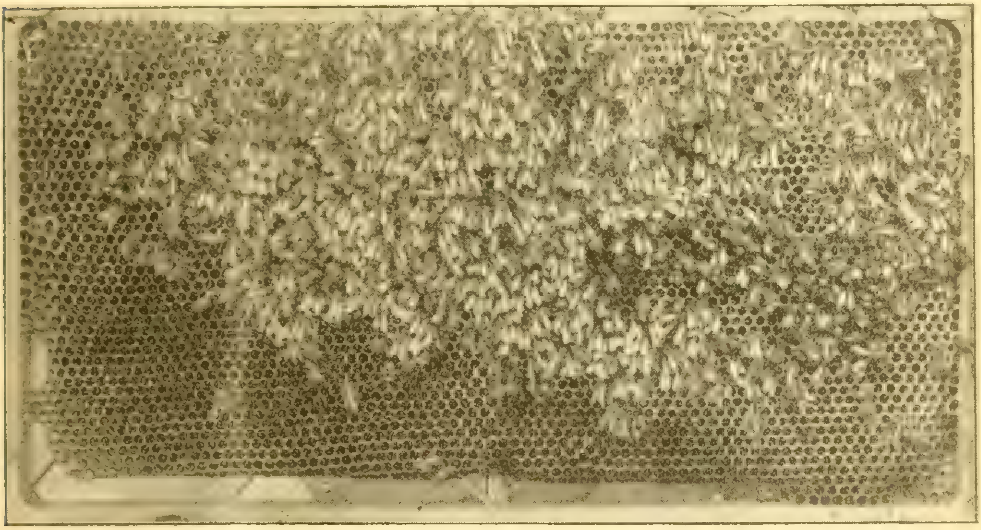
That the bees would die within an inch or less of such passageways, as spoken of above, and that such death of bees rarely occurred except during the first heavy freeze each fall, led me to investigate the matter closely, said investigation proving to my mind that these bees died from lack of vitality (or old age) rather than from the cause assigned. Usually we have cool cloudy weather from two to four weeks before the first severe cold, so that the old bees do not leave the hive to any extent to die, as they do all through the summer months, so that the number of dead bees dying from this cause would be considerable, providing none were chilled. But at this time of year, instead of dying at once these old bees seem to linger along for a chance to get out of the hive to die, and so gather in little clusters of two, three, six, or more, in a place, where they remain in a sluggish state till caught by extreme cold, or a chance is offered for a flight.

I well recollect one year when a fine warm day occurred immediately preceding the first very cold weather. The bees all flew nicely, and at evening I was surprised to find sluggish bees clinging to the board walks, fences, etc., all about, while close examination showed them all around on the grass and ground. This season I had the same thing occur, only to a far greater extent, as the most of the colonies with which I go into winter quarters are composed of united nuclei, hence had many old bees in the hives. After their flight the 14th of November (the 22d day of October being their last previous flight), I found little knots of bees all about on the corners of the hives, on the grass, ground, and walks, to an extent beyond what I ever saw before. When I saw these knots of bees several years ago, I believed then, as I do now, that I had discovered the real cause of the matter, and, sure enough, no little clusters of dead bees were to be found about in the hive that winter, nor do I think there will be this winter, but all were clustered compactly for winter without passageways. Then, again, I have often noticed that these little knots of bees were left to die only with the first contraction of the cluster, as afterward no gain of dead bees seemed to be made among the combs with each expansion and contraction, while the advocates of these winter passageways state that this loss is kept up every time it warms up and turns cold again, all winter.

There is one way to prove all these things; and that is, by setting apart a certain number of colonies and making passageways through the combs, while another number like the first are left without. A careful comparison of the two lots, during the *whole* winter, will tell who is correct in this matter.

Borodino, N. Y., Nov. 17. G. M. DOOLITTLE.

[Mr. Doolittle may be and probably is right regarding the general cause of small knots of bees dying away from the cluster. Some three or four years ago, in a chaff hive a whole colony died on the combs. It was a very cold winter, and the bees probably, during a severe "cold snap," starved to death, although there was plenty of good sealed sugar stores within two inches of the cluster. It was a nice large colony, and the bees were scattered over the combs as natural as life. One could scarcely believe them to be dead, so natural were they. It occurred to us that we could secure a good picture, because, you know, they would "hold still;" but the result is not as satisfactory as we expected to get. A glance at the picture, which has not heretofore been printed, shows no honey in the comb, but there were stores, and plenty of them, in the next two combs. Evidently these bees died of starvation. No doubt many of our readers, in outdoor wintering, have witnessed the same. In all our experience we have scarcely one out of 200 colonies die in this way.]



BEES THAT DIED ON A COMB DURING WINTER.

THE WINTERING PROBLEM (?) IN CALIFORNIA.

WINTER FLORA FOR BEES—WHAT, AND WHEN IT OPENS UP.

In most of the States of our Union the wintering problem is the most serious one which confronts the bee-keeper; but in the warm climate of California and of the Gulf States, "wintering" does not rise to the dignity of a problem. Even in these places, however, there are some precautions to be taken and some things to be done for our little pets ere they enter upon the season of rain, frosts, and enforced idleness.

The first thing to be done is, to see that each colony has an abundance of honey. Twenty pounds is plenty, not only for wintering but for springing; and where the supers are taken off, some pounds less than that amount will be sufficient.

The next requisite is, to see that the hive is a snug one; that is, that there are no chinks by which cold air can enter and warm air leave the hive, especially near the top; then reduce the entrance so that only one or two bees can go in at a time, and all the precautions necessary for safe wintering have been taken. Very simple; yet, for lack of them, thousands of colonies are lost every winter.

Most apiaries run for extracted honey are left with the supers on during the winter. My experience is, that it is much better to take them off, as the stocks build up faster in the spring, and swarm earlier. I leave the extracting-combs in the supers, spreading them so that no two touch, piling the supers three or four high, placing a tight cover over them to keep out the rain, and then I pile on rocks to hold the whole fast against the winds. There is no trouble from moths until April, at which time I replace the supers on the hive. Mice, however, will ruin the combs if they can get at them.

My estimate of twenty pounds of honey, or even less, for wintering, may seem too small a quantity to those who have read in the text-books that thirty pounds is about the right amount. But remember that the instructions given in the books are for northern climates, where for six or seven months the bees will have no other food than that thirty pounds. But here in California our bees can gather honey every month in the year, if the weather is favorable. In localities where manzanita is plentiful I have seen enough gathered from that source in January to make quite a showing in the hive; and the fillaree (spelled incorrectly, but I believe in Anglicizing all foreign words) in all parts of California, excepting the deserts and snow-clad mountain-tops, furnishes considerable honey by Feb. 15th; and when near the sea, or in other warm localities, some two weeks earlier than this.

With me, November and December are the only months in which the bees gather practically nothing; but it may be different with apiaries located but a few miles away; for in this mountainous country the climate, and, consequently, the vegetation, differ with the altitudes. Nearness to the ocean has also its effects on the climate. At the town of San Buenaventura, which overlooks the Pacific, winters in which any frost is noticeable are the exception, and the busy little bee gathers honey all winter long from the strawberry-plants blossoming in the Chinamen's truck-gardens. Again, at Cowhanger Pass (a corruption of the Spanish word "Cahuenga," pronounced *Kah-wain-gah*), which is high up in the mountains, but located in what scientists call the Thermal Belt, there is never frost, and tomato-vines grow with the luxuriance of Jack's beanstalk—an historical plant well known to the youths of our land. I have read of vines of this kind (tomatoes, not beans) which had attained to the length of 80 feet; but then, one must not believe every thing he reads about California. It is a great country, no doubt, and excels in many things, the least of which are not its liars. But I am wandering. From winter honey-plants to tomato-vines and prevaricators is quite a jump. From a lowly bee-hive to the top of a eucalyptus or Australian gum tree is also a good jump, but one which the little bees take, and in midwinter too, for I have heard them humming very numerously among its blossoms on Christmas day.

The pepper-tree is worked upon in winter as well as in summer. In fact, they are liable to burst forth into bloom almost any time, in which peculiarity they are the counterpart of the guatemote (a shrub growing in damp ground), on whose blossoms I see my bees are at work today, and on which they will continue to work every favorable day until spring, with blossoms more to the bees' liking, causes the guatemote to be neglected. I have just made a little circuit of about 200 feet around my house, and in that little space on the 5th day of November I find my bees working on six different kinds of flowers. I doubt, though, whether they are getting enough from them to live on, as they are very keen at robbing, only yesterday "cleaning out" a weak stock.

SPELLING OF SPANISH WORDS.

Now in defense of my incorrect spelling of Spanish words. Most of the names of places here are in that language, and, besides which, the Americans have adopted a great many other words, such as *vaquero* (pronounced *vah-kay-ro*, meaning a herder), and *chemescal* (a bush), and which they pronounce most abominably. For instance, *vaquero*, the Americans pronounce *buck-kai-ro*, and *chemescal* they call *jimmy-sal*. Cowhanger, the place mentioned as where there is no frost, is spelled Cahuenga, as already observed. Now, I maintain that, if we are not able to give to these words the Spanish twang, we should spell them according to our pronunciation, just as John Bull has transformed the celebrated London driveway from "Route en Roi" (King's Road) into Rotten Row.

Wm. G. Hewes.

Newhall, Los Angeles Co., Cal., Nov. 5, 1892.

[Yes, yes, by all means Anglicize those hard Spanish names.

Later.—After reading the above we were inclined to indorse Mr. Hewes' suggestions, and did so in the footnote as above; but our proof-reader, who understands Spanish, takes issue with us both, in some respects, in this pleasant and facetious manner. His points are so well taken, after all, that we shall have to conclude it were better to leave the names as they are, for the most part.]

The suggestions of Mr. Hewes in regard to "Anglicizing" Spanish names in California are very ill advised. If the people there see fit to change the word Conejo (meaning rabbit or jack-rabbit) to Jacksburrow, and have it so spelled in the Postal Guide, as the junior editor means above, no objection can be raised; but to ask the postal authorities to deliver a letter directed to Cowhanger when Cahuenga (Kah-*wain*-gah) is the official name, is unreasonable. If it is necessary to change foreign words, why have we not found it out in using Indian names for nearly half the States in the Union, besides cities, lakes, rivers, etc., by the thousand? How would it do if the people of Michigan were to conclude that they can not say Kalamazoo, for instance, and twist the word to Kalamityhowler? or Dowagiac to Doodenwhack? or Chicago (meaning a polecat in Indian) to Shecowgo, in honor of the historic cow whose potent kick laid that city in ashes? Mr. Hewes speaks of the Spanish language as having a "twang." That is a mistake. It has no twang. For beauty of sound, it probably has no rival in the world, except Italian. It has no sound that we do not have in English, and it is spelled in a purely phonetic manner — Filadelfia, for instance. It has but five vowels—*a, e, i, o, u*, pronounced as if they represented the English letters *ah, a, e,* *o, oo.* The letter Y has the sound of I. This enables a pupil to learn to read it quite well in one lesson, while a foreigner can learn ours only by studying a word at a time, and that, too, by the help of a teacher. It is very undesirable to change the names in California, except in some obscure instances. Why would its chief city sound any better if called Saint Francis, or the capital if spelled Sacrament? San Buena Ventura means Good Luck personified into a saint; San Jacinto means St. Hyacinth; San Diego means St. James, or Holy Jim as some might "Anglicize" it. The names in California, New Mexico, and Arizona, for one who understands Spanish, are almost as good as a book of travels in those States; and even in English, how much is contained in such words as Good Hope, Cape Desolation, Cape Farewell, Iceland, Greenland, etc.! A very valuable feature could be added to our schools by teaching the pupils to pronounce the names found in foreign countries. Some of them look hard, and can not be pronounced with our alphabet; but by knowing how, the words become as soft and musical as—Cowhanger, for instance. Let the old names found in the United States remain as they are, to show how the nations of the earth have brought their treasures into it. The Spanish have left an air of romance in that part of our land which they settled, and it seems too bad to dispel that romance by the introduction of our everlasting "centers," "villes," "burys," etc. The English language grows fat by browsing on all others.

CARDINAL FLOWER.

PROF. COOK REPLIES TO W. E. GOULD'S CRITICISM ON PAGE 800.

I am glad that Mr. Gould has corrected me in the matter of the cardinal flower. From the reports I had, I supposed there could be no question but that the bees did secure honey from it. I did not see, from the data which I received from apparently the most reliable authority, that there could be any doubt, and so I wrote as I did. I am satisfied that Mr. Gould is correct, and I take his reproof very kindly. We should be very careful, before we generalize, that our facts *are* facts. The best of men make mistakes, and I shall be more than ever careful henceforth that reported facts are genuine. Again I thank Mr. Gould.

OAK-GALLS, OR OAK-APPLES.

Mr. Allen Bartow, Milan, O., sends me several oak-galls, and the gall-flies which cause them. He says that the insects are very new and singular to him. He requests that I explain their life economy through GLEANINGS. The four-winged gall-flies belong to the same great order of insects that contains our bees—the *Hymenoptera*. They belong to the gall-fly family, or *Cynipidæ*. The cynips are usually black, short, four-winged flies, with a very obtuse abdomen. This looks as if it had been pushed up from behind, and is like that of the bees, wasps, ants, and parasitic hymenoptera, in that it ends in a sting, or ovipositor. As these flies lay their eggs they irritate the leaf or stem, and this causes an extra flow of sap to the place, and the result is excessive growth, or the galls, which are familiar to all. These galls surround the eggs, or larvæ after the eggs hatch, and thus the gall serves both as home and food for the immature or larval gall-fly. We may say that the gall is simply increased growth. If the stem or leaf is hairy, the gall will very likely be spinous. Some of the galls are very smooth and beautiful. They are found mostly on oak-trees, though not exclusively, as the rose cynip infests the rose-bush, and causes galls on it. Odd as it seems, each fly produces a peculiar gall, so that the galls are as distinctive as are the flies that produce them. Why the irritating puncture of one fly should produce one kind of gall, and that of another something different, is not easily explained. May be the poison differs in quality or quantity, and possibly the wound may vary in extent, and so control the size and character of the gall. We often raise not only the gall-flies from the galls, but also guest-flies. In this case a sort of tramp fly takes advantage of the gall and lays its eggs in it, and its young also feeds on the gall. These guest-flies are nearly as numerous as are the gall-flies. Sometimes the males are in different kinds of galls from the females. In many cases no males have been found. It may be that some of these species are parthenogenetic, like plant-lice and our drone-bees—produced without males and sperm-cells. It is easy to secure the gall-flies. The only precaution is, not to pick the galls from the tree till the larvæ are mature, else the galls will dry up and the larval gall-flies will starve.

WALKING-STICKS.

I have received some walking-sticks from Mr. C. L. Parker, Mentone, Ala. These are well named, as they look like sticks with stick-like legs. We have one in the north—*Diapperomera femorata* —which is green when young, and brown when mature. I was specially glad to receive these from Mr. Parker, as they were new to our collection. I am not sure of the species, but I think it may be *Anisomorpha buprestoides*. The male is very much smaller than the female. They were mating as I took them from the box in which they came. There were also eggs in the box. They live on leaves and twigs, which they so closely mimic that it is hard to find them. They feed on the foliage, but are rarely so abundant as to do serious harm. They drop their eggs from the trees in which they dwell, and, when very abundant, the dropping eggs make one think of a rain or hail storm. They belong to the same order of insects that contains the crickets, locusts, and grasshoppers.

THAT SLUMGUM.

SOME INTERESTING EXPERIMENTS WITH THE SOLAR WAX-EXTRACTOR; HOW TO GET ALL OF THE WAX OUT OF THE SLUMGUM.

I read with interest H. R. Boardman's article on p. 771, also the offer you make in your footnote. I want you to make your test thorough. Surely much wax remains in the refuse when it makes so good a fire. Sometimes, however, its burning quality might come from propolis, which is almost equal to wax for fuel.

Last spring we had a lot of stock to transfer, both with and without frames; also a like lot of hives in which the bees winter-killed. In all these the honey was from one-fourth to three-fourths candied. Nearly all of them were old combs, some very old, and many with pollen. Then the query was, how to get this separated into feed honey, wax, and slumgum. We could not feed the honey by letting the bees carry it out of the combs, for they would waste the bulk of the candied honey by "kicking it out of doors." The honey thus wasted would be worth more than the combs or wax. To render by steam or water applied directly would waste much honey; so dry heat, by means of the solar wax-extractor, seemed the best way to do it.

My heart was set on having a jumbo solar (it's set yet, only more so than before); so, early in April I bought some double-strength glass, cut from broken store-windows, showcases, and such. It cost me $2.50 at the price of single-strength glass, and made a sash about 2 ft. 10 in. x 6 ft. 6 in., and I very soon had a solar wax-extractor at work in the yard. The thing is built on wheels, two at one end and one at the other, one of them being pivoted like a bed-caster. This makes it convenient to pull about, and to wheel into the honey-house to unload and reload when robbers are bad. From April to October that extractor has been at work, and has turned out over 300 lbs. of wax and over 1000 lbs. of feed honey that was mostly candied in the combs. The wax is No. 1 in quality.

After accumulating two or three barrels of the refuse I experimented on it. Some was soaked four weeks in water, and cooked by steam applied direct. Some was soaked several days in a mixture of water and concentrated lye, so strong it was a slick, soapy mass, and it was cooked by steam applied direct, with the mass in a bran-sack. I used steam under pressure, and turned a jet of steam into the center of the mass. I tried first by having a false bottom made of slats about six inches from the bottom of the barrel, and the sack in this, so the wax would drip below and run out at the bottom. This brought out some wax, but left plenty to make a good fire. I then plugged the hole at the bottom of the barrel, and filled the barrel with water, so that the whole mass was submerged. I then applied the steam-jet as before—that is, to the center of the mass in the sack. The jet was applied for nearly half a day, with stirring, turning, and prodding the sack. As fast as wax would accumulate on the water it was skimmed off, until it seemed that scarcely a bit could remain in that sack. I then took the sack out. At first it contained about four bushels of the slumgum; but now it was reduced by washing out pollen, etc., until it was about a bushel. I then put it under moderate pressure. This caused the wax to flow "from every pore," resulting in one or two pounds more of wax. I then again put the whole mass into cold water, when the wax appeared in small grains throughout the whole mass, about as butter does just as it begins to gather when being churned. I now have a barrel of this refuse soaking in lye-water, and will experiment to see what wax can be gotten from it.

The refuse used in these experiments was the result of rendering over 200 lbs. of wax, using mostly those old combs and hive-scrapings, etc. The result was something over 20 lbs. of wax that was much darker than the first, as gotten by solar heat. Both because we had to keep the solar extractor going in order to get our comb all rendered, and because we expected to subject the refuse to the second process, it was not as thoroughly drained in the solar as it might have been. However, the wax received from it paid about $2.00 a day for the time engaged in putting it through the process.

I am confident that neither the solar nor steam process comes near getting the wax all out. Old combs, pollen-filled, together with dead bees and such, make such a mass of refuse that a great amount of wax is retained in it, in spite of all my efforts so far to remove it. I find, however, that we need a large solar extractor, and then not load it too heavy. If the refuse be drawn back to the upper end, and spread out thinly on a rather steep incline, and left there a few days in the hottest weather, and for about four weeks when not so warm, very much wax will eventually be drained out that can not be gotten out in two or three days' time. If the solar extractor be large enough, and the stuff left in it long enough, I think more wax will be extracted than by steam or water. The feed honey alone that can be obtained by using a solar extractor abundantly pays for the instrument, besides the other points of advantage. But what I want to know is an equally cheap method of getting the rest of that wax out of the slumgum.
R. C. Aikin.

Loveland, Col., Nov. 7, 1892.

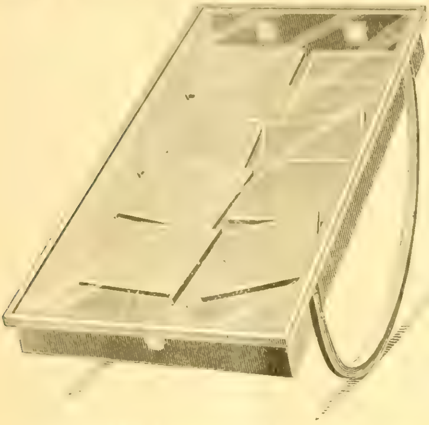
[Your experiments are interesting and valuable, and we believe the results at which you arrived are correct, as they confirm to a very great extent our own. From old tough and black combs it is exceedingly hard to get the wax all out. The Dadants recommend first pulverizing them during cold freezing weather. At that time, being very brittle, they will work up very fine. Now, then, the best way to render this, so far as we know, is to spread this pulverized comb thinly over the bottom of a large solar wax-extractor. Allow it to stand that way for several days in the hot sun, stirring it occasionally in the mean time, so as to present new surfaces to the sun. After it seems to have drained out all the wax there is in the slumgum, clean out the extractor, put the contents into the slumgum box or barrel, and be sure to cover it tightly, because the moth-worms will very soon begin work on it. After a barrel or so has accumulated, put it into a cheese-cloth (or, preferably, burlap) bag, as large as can conveniently be put into a receptacle in which it is to be further treated with hot water slightly acidulated with sulphuric acid. Get the water to boiling, and with a stick punch the sack under water; and as the wax rises, skim it off on the surface of the water. Last of all, remove the sack with its contents from the boiling water; quickly place it in a press; squeeze it, putting on all the pressure possible, and considerably more wax will ooze out in small pellets.

The solar wax-extractor will take out perhaps nine-tenths of the wax; but there is yet left that tenth, which must be removed, as far as possible, by the agency of hot water, sulphuric acid, and the wax-press. Even then there is a little left that may be removed by continually working at it, but it is a question whether it is worth the time consumed in doing it.

THE RESULT OF THE EXPERIMENT ON THE BOARDMAN SLUMGUM.

Referring to the slumgum of H. R. Boardman, and our challenge to him to send on a couple of bushels and we would prove there was wax it, we have this to say: He sent on the slumgum, and by the scales it weighed about 25 lbs. We put it through the "mill"—that is, the sulphuric-acid treatment—in connection with the wax-press. Well, how much wax do you think we secured? *Just one pound!* We scarcely know whether Mr. Boardman or ourselves have the better of the argument. He may be surprised that we got so much, and on the other hand we are surely disappointed in getting no more. On this basis we should get about 3 lbs. of virgin wax from perhaps a barrel of Mr. Boardman's slumgum. If there is one thing that we have proven, it is that Mr. Boardman's large solar wax-extractors do the work very much more thoroughly than we had supposed; and we can account for the stuff making such good fuel, only on the ground that it must have contained a large amount of propolis, as Mr. Aikin suggests above. It is well known that propolis melts at a much higher temperature than wax, and it is possible that the heat of the solar wax-extractor is not sufficient to have any perceptible effect on it. It is, therefore, left nicely distributed through the refuse.

Some time ago we illustrated the Boardman solar wax-extractor. As many of our old readers have possibly forgotten what it is like, and some of our new ones would like to see it too, we present the engraving again from p. 50, Jan. 15, 1891. A description will hardly be necessary.



BOARDMAN'S SOLAR WAX-EXTRACTOR.

We might mention that the curved runners not only make the machine portable, but permit of its being tilted at any angle to the sun.

We should like to hear from others who have had experience with the solar wax-extractor, and particularly as to how to get every particle of wax out of the refuse and the cocoons. This matter is not so valuable to the foundation-maker as it is to those who render out their old combs for the wax which they send to the manufacturer.]

BASSWOOD AND ITS PROPAGATION.

WHY ITS SEEDS DO NOT GROW.

A few years after coming to this country, from the old continent, I sowed seeds of basswood in order to get plants and trees, when of suitable size, for my near neighbors, to be planted on the roads along their farms. Most of the roads in France are lined with trees such as basswood, elms, walnuts, ashes, etc.; besides, there is, in the city where I was educated, a promenade about two miles long, with four rows of lindens, of which the trunks are three feet in diameter or more. About 60 years ago I asked my grandfather how old those trees were, adding that, probably, he had seen them planted. He answered, "When I was of your age they seemed about as large as they are now." So these basswoods were planted several hundred years ago.

The remembrance of the beautiful foliage, delicious perfume, and agreeable shade of these rows of trees, together with the prospect of increasing the honey harvest, had induced me to make the expense of raising these lindens; but not one seed in one hundred germinated. As I had sown them in spring, I thought that the seeds were too dry, and so the next summer I sowed seeds just gathered. These did not succeed any better than the first ones. Then the following summer I broke some seeds to find, if possible, the cause of my failure. Nearly every one was eaten inside by worms. About two years ago Mr. Ed. Bertrand, editor of the *Revue Internationale*, wrote me that one of his friends desired to get a few pounds of American basswood seeds to raise trees, and distribute them among his neighbors. I sent him a few hundred seeds only, to show the conditions which prevented the American basswood from growing from seeds. As these seeds are eaten by small insects, it would proobably be possible to kill them before laying, or to prevent them from laying by spraying London purple or other insecticides on the trees just after their blooming.

I hope that Mr. L. C. Clark, or some other bee-keeper, will try this spraying, and report in GLEANINGS the results obtained.

CHAS. DADANT.

Hamilton, Ill., Nov. 21, 1892.

RAMBLE NO. 73.

ADVICE ABOUT EMIGRATING TO CALIFORNIA; QUESTIONS ANSWERED.

Since I came to this beautiful southland, the land of sunshine and flowers, and the home of the fragrant rose, where the rich green leaves of the orange and the lemon never wither, and their blossoms fill the air with fragrance, the hive with honey, and the fruit gives health to the body and inspiration to the soul; and especially since A. I. Root and I have written about California bee-keeping, I have not been flooded with letters of inquiry, but have received as many as three in one day, and usually two or three a week, which shows that there is something of an interest in relation to this State as a country in which to gain a livelihood, and perhaps wealth in this world's goods and a hope for future bliss.

This ramble, then, is written for the purpose of answering a multitude of past, present, and future questions; and all of these persons, either young or old, who have a desire to emigrate to California will please read this Ramble ten times, feel their pulse, and say, if they can, "*No tengo nada*" (nothing is the matter with me, as the Spanish say).

In the first place, California consists of a large area of land and not a great deal of visible water. Much of the land hangs up edgewise, and well up toward the heavens. There is, however, enough rich level and rolling land and charming valleys to support an immense population. Water is made visible by tapping the mountains and valleys, and the effect is magical, for the barren desert is made to blossom with vegetable life. As to climate, there is no country in the world where one can select just what suits him as well as in California. If you delight in a temperature of 115° in the shade, many of the interior towns will fill the bill during the summer months. If you prefer arctic breaths, climb the mountains into the regions of perpetual snow. In fact, any grade of temperature can be selected, and that is the boast of California.

The State is bounded on the west by the Pacific Ocean. I mention this, because many seem to forget it; and when they get here they sit down upon the shore and shed tears over the overwhelming fact that this is the end of westward emigration. In a great many instances, instead of taking a rational view of the situation, they turn around and berate all California.

California is called the Golden State, and it deserves the name. There have been rich discoveries of the precious metals, and sudden fortunes have been made; but remember that, alongside the lucky man, there have been a thousand who have toiled all their lives, and then died poor. Remember that even the man who first discovered gold, and picked it up by the handfuls, died a poor man; therefore, my friend, don't let the alluring idea get into your head, as it does into many, that you can pick up gold in the Golden State; for, go where you will, in valley or remote mountain, you will find the mark of the prospector's pick or shovel. The ground has been well inspected. There are yet undiscovered gold-mines, but the novice will hardly find them.

The cultivation of the soil, and making the various products grow, is at present producing more gold for California than are her mines of yellow metal. If you wish to enter the ranks of this class of workers, I will answer the questions that have been directed to me, and thereby try to aid you in a decision for future action.

The majority of my questioners are bee-keepers, and are not only anxious to keep bees but to secure a fruit-farm in connection with it. There are ranches where, in some cases, bees and fruit are kept; but the cases are exceptional. The fruit-ranch destroys all wild flowers that produce the large yields of honey; and unless the ranch is well back in the foothills, where bees from it can reach the sage and other wild flowers, the apiary will have to be planted, as it usually is, in some remote place, to secure the best results; therefore, to keep bees and run a fruit-ranch will necessitate two locations. Continuous employment can not be secured on a bee-ranch. The bees need but little attention for seven or eight months. In the other four or five the main work is done, and men and boys are then hired. Some bee-keepers run their help in gangs, going from one apiary to another during the extracting season. Others put a man in an apiary, and expect him to be enough of a hustler to care for it. The pay for such a helper is all the way from $25 to $50 a month. At $25 a month he is boarded; but at $50 he boards himself.

There are but few chances to work apiaries on shares. Where they can be found, the right man can do better than to work by the month. Bees and apiaries are as salable property as horses or cattle, and many apiaries change hands every season. Above all other plans, I would advise those who come here to do so prepared to purchase. Easy terms are usually granted, and a small apiary in a good season can be increased to quite a large one. An experienced bee-keeper can easily double his number, while many have increased ten to one hundred—remember, in a good season. The time to buy is from January to March. Colonies can be purchased, all the way from $1.00 to $5.00; the average price is, perhaps, $3.00. The $1.00 colonies are in nondescript boxes. The $5.00 colonies are in good movable-frame hives. Considering every phase of the business, I know of nothing else that can be started into with so small a capital, and which gives so sure and quick returns as bee-keeping. The above does not apply to a person who never managed bees, but to a man of experience, and a moderately good season.

Southern California has been the center of the bee-industry for several years; but in the northern counties there are many splendid localities for bees that are as yet unoccupied. □

Next to the production of honey, information in relation to fruit-ranches is sought. Fruit-ranches are usually sold in 5, 10, and 20 acre lots; the average is about 10 acres. The chief fruit here is the orange, with a sprinkling of all other fruits. A fruit-ranch of any kind, except grapes and small fruits, is several years getting into bearing. Raisin grapes, perhaps, bring the quickest and most permanent returns. These fruit-ranches can be purchased on easy payments; but the purchaser should be careful to have some money ahead, or some business to earn money (an apiary, for instance), or he may wake up some morning in arrears, and his ranch, with what improvements he has put upon it, is taken possession of again by the Land & Water Company. Many such episodes happen every year.

Fruit-lands unimproved, but under irrigation, are held at from $100 to $350 per acre. Some companies give a perpetual water-right, while others collect a tax for the number of inches of water used annually. Improved lands with bearing orchards are held at $1000, and even up to $3000 an acre. A twelve-year-old orange-orchard in full bearing will give a profit of $1000 an acre.

The style of houses that people live in here is of great variety. Just now around Redlands there are scores of tents. During a greater portion of the year a tent will be comfortable. Some prefer to sleep outdoors, and gain health in so doing. A tent is preferable to many of the shanties that are occupied. Almost any kind of covering will do until the rainy season commences. In December and January the cold, though not below 24° above zero, takes hold quite severely. Rain is not continuous, as many suppose, but it comes down freely for a few days, then there is a week or more of beautiful weather; so, ordinarily, what is called the "rainy season" is not any more so than Eastern people have all the time.

Lumber is more expensive than in the East, and a good house will, therefore, be quite a luxury. In this portion of the State, wood and coal are scarce and dear. Oak wood is $8.00 a cord; chemise roots, $5.00 a load; soft cottonwood, $3.00 a cord; choyo, a species of cactus, and sunflower-stalks, are gathered for fuel.

The cost of living here is more than in the East. Good board is 25 cts. a meal, or $4.00 a week; a furnished room $4.00 to $10.00 a month. A person can board himself for about $2.00 a week, and so thousands "bach" it on this coast, and live well, and have more luxuries and greater variety than he gets in a dining-hall.

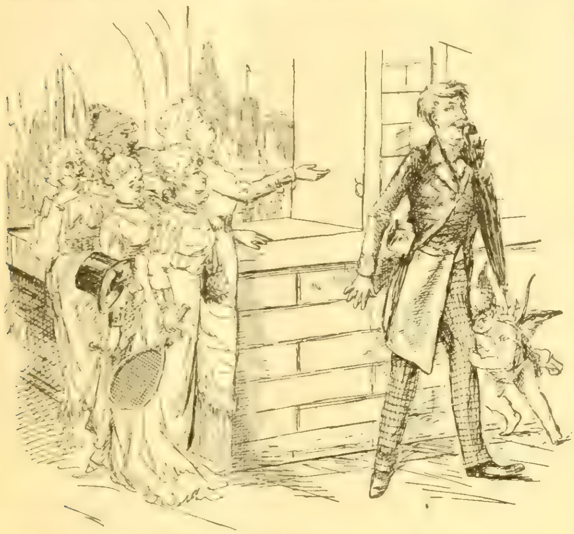
From the number of idle men about our towns, I doubt whether permanent employment can be had by the year on a ranch or in the trades. There are times when everybody is busy; then come the idle days. There is but little done in the manufacturing line, and the surplus labor is not absorbed. A new comer has not so good a chance to get work as one who has been here a year and has made something of a reputation. Wages by the day is usually $1.50 to $2.00. The laborer finds himself, except his dinner. On the large ranches, away from towns, he is boarded on the ranch, and sleeps as described in Ramble 67. The trades are quite full, and the carpenter and bricklayer complain that there are too many for profit. Still, I have heard of no starvation or want in that quarter. Ready-made clothing can be purchased here nearly if not quite as cheap as in the East, while clothing made to order will cost more.

A person in Kansas asks, "Shall I bring my team?" It would, perhaps, pay a man no further east than Kansas to bring the team if it is worth, say, $300. Good horses are in demand, and teamwork is sought after. Very good furniture can be purchased here at second-hand stores, at reasonable rates.

In relation to shipping bees from the East, it would hardly pay unless a car is chartered for other things, and then a few colonies of a choice strain could be put in as well as not. Ten colonies, say, and a lot of hives in the flat, would give an outfit that could soon be increased to a fair apiary. Still, it is a question whether it would pay to ship them. Government land can be found, but it is in remote districts, and not subject to irrigation without much labor to develop water.

The educational advantages are good unless a settlement is made in a remote portion of the State. California provides fine—yes, elegant—school-buildings. The one described in the last Ramble is a fair sample. Care is also taken for the proper qualification of the teacher. The standard of excellence, I think, is higher than in many Eastern States, and the pay they receive is proportionately higher.

Religious work is very active all over this coast. All of the orthodox churches are represented, and some that are not so orthodox. In nearly every town of 3000 population or over. the Y. M. C. A. is an active force. The Salvation Army is aggressive and progressive. In California is exercised the greatest amount of toleration, religious and otherwise. We go to church, and, while listening to the sermon, perhaps the musical notes of a hand-saw or the staccato of a hammer is heard in the back yard of a man who is not so conscientious about the use of the Sabbath as we are. Or there may be wafted to your ears the distant report of a gun. This man seeks his recreation on Sunday in hunting rabbits or quail. No one seems to have much concern as to how his neighbor spends the day. He is a law unto himself in that respect. and that's what we call toleration—something the world has been trying to learn for the past several thousand years, and isn't the world better to-day under this broad spirit than under the iron heel of persecution, and the "thou shalt not" of creed?



RAMBLER AT THE WORLD'S FAIR: "BARKIS IS WILLIN'."

I have given the above facts in relation to this portion of California. I have no advice to give, but am desirous for every would be emigrant to act upon his own judgment. I would not advise parties to tear themselves away from passably good circumstances at a sacrifice; for in all such cases there is more or less hardship and some disappointments to endure in a new field of action. Our bright skies are somewhat shaded with sandstorms; and during the dry months the dust is "numerous;" but when it comes to a choice between mud and dust, dust does not afflict when we ride against the wind; but mud we have to take, wind or no wind. It is an excellent plan to first come and see the country, and find a location. The family can then be brought out. With a little money, profitable investments are always open in these new growing towns; and a tract purchased now will, in a very few years, double in value. A journey, however brief, to this coast, will enlarge your ideas in relation to the great and glorious country of which you are a citizen. If you have but a latent pride in your nation as you have seen it in the East, under these skies what is latent will be fanned into a patriotic flame, and the old stars and stripes will ever after have a new meaning to you, as they now also have to the RAMBLER.

[Our readers will notice that this article of Rambler's is conspicuous on account of the absence of any engravings accompanying it. The Rambler thought it might be a pleasant change to the readers; but the more we thought of it, the more we felt impressed that the usual Ramble would look lonesome. Well, it so happened that our artist came to our rescue. He was thinking how lonesome Rambler must be off on the ranch keeping house all by himself; and as his mind turned toward the World's Fair, he began to speculate as to whether the Rambler would be present. A picture came before his mind; and, of course, being an artist, it naturally found expression in material form, and *we* couldn't resist the temptation to place it before our readers, for you know the Rambler is a single man.

It seems that Dr. Miller and A. I. R. have been rather worrying because Rambler has been dwelling in single blessedness. Perhaps this will give them a gleam of hope. The Rambler has given us no authority to speculate as to his future prospects; and if the picture above will not represent the true status he must lay all the blame upon our artist.]

BEE PARALYSIS.

EXPERIMENTS IN REGARD TO THIS DISEASE.

During the early part of the season, Mr. Ford, as below, purchased a colony of bees with a queen. Bee paralysis subsequently developed, and he wrote us, asking for particulars for treatment. We advised him to try the salt cure. He did so, but it seemed to have no effect, and the bees continued to grow worse and worse. It seemed to be a peculiarly aggravated case of the disease, and we desired our correspondent to keep us fully informed.

Desiring to experiment further with my diseased bees, and thinking there might be some infection in the combs or hive, I transferred the colony a few days since to a new hive, giving them new comb and a frame of sealed comb from a healthy colony. They are dying at a more rapid rate than before. Robbers have begun to assail the diseased colonies, and I think that they will soon clean them out in spite of all that I can do.

A friend has suggested that the disease might be foul brood. I find that the few cells of brood left are apparently healthy, and the combs appear normal in every particular, so far as I can see. My experience will tend to elucidate the course to be pursued by the apiarist in handling colonies affected with bee paralysis hereafter. If the disease is infectious, at least one-third of my colonies will get it, through the agency of the robbers, who are now plundering the diseased colony not transferred. I have come to the same conclusion reached by you—that bee paralysis is an affection resulting from some infirmity in the queen, or some hereditary disease. Is it possible that it may result from breeding from the same stock for a long time? When I began to Italianize my apiary I resolved to buy my queens from as many breeders as I could conveniently, for the express purpose of securing ultimately the strongest vitality in my new stock by the admixture of many strains. I do not know whether there is any thing in the notion or not.

I believe the disease is not contagious or infectious, and that it does not result from the food the bees take. If I am mistaken on these points I shall probably lose most of my bees. I would have removed the diseased colonies, but I thought that the infection, if there was any, would be carried by the stray bees that would seek refuge in other colonies, their hive being removed. T. S. Ford.

Columbia, Miss., Nov. 5.

[We have never discovered that the disease is contagious. It seems to be wholly hereditary, and, so far as we can remember, we have put healthy colonies into hives formerly occupied by bees affected with bee-paralysis, with no subsequent bad results on the healthy bees. However, it is possible that, in aggravated cases, such hives might transmit the disease, and we hope our correspondent will keep us informed as to the result. We suggest, as a last resort, that he remove the queen and introduce a healthy one. If the trouble is wholly hereditary, this ought to cure the trouble; at least it has done so in our own yards so far.

Since writing the above, the following has come to hand, giving the other side of the salt-cure question.]

THE SALT REMEDY A SUCCESS.

Friend Root:—Permit me to give my experience as to what is supposed to be paralysis, as stated in Gleanings, page 817. I think it was in the spring of 1889 that the disease first made its appearance in my apiary, when I commenced to Italianize. I gave a statement through Gleanings, page 845, 1891, as to the salt cure, which I then was fully persuaded was an effectual cure for the disease called bee-paralysis. I have continued to make use of a strong solution of salt water ever since, by the use of a toy squirt-gun, once a week during the season, from spring till fall, through the entrance, all over the bottom-boards, and no one could possibly have had more healthy and beautiful leather-colored bees than I had when the spring of 1892 appeared; and as the weather continued wet and cold I decided to abandon the salt cure, and, up to about the middle of May, not a bee that I could see showed any signs of the so-called paralysis, while others around this section had noticed their bees somewhat affected. On Sunday morning, about May 15, at 8 o'clock I noticed a wonderful commotion among the bees. Thousands upon thousands scrambled from the hives, and, after a few jumps up and down, would be dead, and they seemed to be about a half larger than their usual size. The sight was so horrifying to me that I hastened to the house to tell my good wife that all of our bees were dying and that I was real sick at heart, and didn't know what was the cause nor what to do. I just felt like sending for the physican, not for the bees, but for myself; but just at this conclusion my wife had come in and said, "Let us try to do something to save some of them." She proposed to make some salt water and sprinkle the bees. "Good!" said I; and we hastily warmed three gallons of water with one teacupful of salt (chloride of sodium) added thereto. Stripping the oilcloth from the hives, with dusting-brushes we thoroughly wet combs, bees, and all, while the bees continued to pass out and die. However, as soon as the water began to drop through on the bottom-boards we noticed hundreds of bees eagerly sipping; and in one hour's time but comparatively few bees were passing out. I said to my wife that I didn't believe there were any more bees to come out; but on examining we found to our surprise a fair showing of bees and lots of brood in all stages down to eggs, and not a queen. I am fully satisfied that, if the dead bees had been gathered up, a half-bushel would not have held them. I know this may look fishy, but such are facts. In three days another sprinkling was given in a lighter form, as here and there a bee was seen to drop; and we continued the remedy as stated, and to-day my bees are bright and beautiful, and no visible symptoms can be noticed that paralysis ever existed, if paralysis it was. Who can tell? There was no time but that brood, capped and uncapped, together with combs, all had a clean and bright appearance, and no offensive odor that I could ever discover.

I want to state further, that bees both old and young seemed to be affected alike. Now, did the salt water check the disease or did it not? I most emphatically answer *yes*, in its broadest sense. One of my brother bee-men stated to me one day last week that he could not see that it was of much benefit to his bees; but such seems to be the evidence about the cure of foul brood; so I am a firm believer in the efficacy of the salt cure. J. A. Golden.

Reinersville, O., Nov. 8.

PRIOR RIGHTS TO A LOCATION.

DR. C. C. MILLER CONTINUES HIS CASE.

"Of course there is no *law* whereby the bee-keeper first in the field could secure the privilege of that field all to himself. The only thing he could do (and that is out of the question) would be to buy up, say, five thousand acres and allow no other bee-keeper to occupy that land. He then has a proprietary right to the whole field." That's what you say, Mr. Editor, on page 802. I doubt whether any one will raise any question as to the correctness of your position. Taking it as standing-ground, let us see if any thing can be built upon it.

If I am not mistaken there are places in California, or, at least, were in earlier days, with plentiful pasturage for bees, but worthless for other purposes. At any rate, it is not very difficult to imagine such a place. Now, suppose a person should buy a tract of 5000 acres of such land from the government, no one would dispute his perpetual right to occupy it exclusively for bees, at least so far as to locate colonies upon it. But, as you hint, he could not afford the price asked for it. He could say to the government, "It is absurd for you to ask me $1.25 an acre for such land, for it is utterly worthless for any purpose except bee-pasturage. No one will buy it for any other purpose; and if you hold it at such a high figure it will be occupied by bee-keeping squatters, quarreling among themselves as to possession. Better sell it to me at 5 cts. an acre than to get nothing for it." And if government is sensible it would reply, "All right. As there seems to be no possible chance that it will ever be good for any thing else, we may as well have $250 for it as to give it away, as we are now doing."

Can you see any thing wrong, so far, in the transaction? But the government might say, "It is true, the land is worthless except for bee-keeping; but some day it may turn out valuable for something else. We are willing to let you have it as you desire, for bee-keeping purposes only; but in case there should be such a change in the course of time as to make the land desirable for farming, we reserve the right to dispose of the land for that purpose, still leaving your title intact as a bee-keeper. In other words we sell you the right to the 5000 acres as bee-pasturage." Would there be any thing wrong in such a transaction? You will see that, in such a case, 50 farmers might occupy the land with 100-acre farms, without in the least interfering with the bee-keeper.

But suppose the 50 farmers first occupied the land, neither of them having any desire to reap its advantages as bee-pasturage, and having bought it with the express stipulation that they were to have no control over the bee-pasturage, would it not be entirely proper for the bee-keeper to buy the bee-pasturage of 5000 acres from the government? You don't see any thing wrong in that, do you? Well, my friend, if that's all right, why wouldn't it be a good thing for the government to dispose of the bee-keeping privilege of the land all over these United States?

"Oh! that's easily answered," you say. "Government can sell only that which is in its possession. If it had reserved bee-keeping privileges when it disposed of its land, then your proposal might be all right; but it has already sold all right and title to the land without any reserve, so it has nothing to sell.

Yes, that sounds all right; but the "greatest good to the greatest number" is the rule; and whenever it is for the general good, the government takes possession where it pleases. I have a warranty deed that is supposed to give me a clear title to a piece of land that measures 100 by 60 rods. I think it is as good a title as any one has; and yet I find I have only a modified right in the land after all. A strip two rods wide was needed for a public road, so three-fourths of an acre is taken off for that. True, I can raise whatever crop I please on the land, that does not interfere with public travel, and so can hold the land against all comers for agricultural purposes; but any one who wishes can travel over it. If I should take a notion that, because I own the land, I own every thing on it, and begin to shoot right and left at the birds upon it, I should soon find out my mistake. There was a time when I owned all the birds on the place; but it was found out that the public good demanded that innocent insect-eating birds should be preserved, so the law took away my birds from me, saying, "Let them alone; they are no longer yours." So you will readily see that, if it should be considered for the public good, the same public would not hesitate to lay its hand on all the bee-keeping interests in the land and control them. But, without further pursuing this line of thought, I want to repeat to you a little conversation I had the other day with my friend Bangs. We had been talking this matter over, and finally Bangs said, "I tell you, it's no use talking; you can't make things any different from what they are; and that notion that, by some hocuspocus, you can let one man own a piece of land and yet not be allowed to keep all the bees on it he pleases, is all poppycock."

I said, "Bangs, would you mind answering a few questions?"

"Of course not," said he; "fire away all the questions you like."

"Well," said I, "please tell me who owns the nectar distilled by the flowers on my place?"

"Well, now," said Bangs, "I didn't know you had a distillery on your place; but if you mean the sweet that's in the clover-blows, why, of course that's yours, just the same as every thing on the place."

"Do you think your bees ever work on my flowers?" said I.

"I reckon they do," said Bangs. "They say bees work two or three miles from home, and mine are only half a mile off."

"Suppose I should put out some poison to kill your bees."

"I guess you ain't likely to do that," laughed Bangs. "It would kill more of your bees than mine."

"Well, Jack Wilson has no bees, and our bees work on his clover. What if he should put out poisoned syrup?"

"Look here, now," said Bangs, "Jack Wilson ain't that kind of a man."

"Why, of course not," said I, seeing I wasn't getting on any. "But suppose I had no bees and was mean enough to put out poison for yours."

"Why, I'd show you mighty quick, if I could prove it on you. You'd have to pay pretty steep for damages."

"Well, suppose I should sue you for what your bees took off my place. How much could I recover, Bangs?"

Bangs broke out into a hearty laugh. Then he said, "Why, that thing's been settled, dead sure, long ago, that bees are freebooters, and can go where they please, so they don't sting anybody."

"So, then," said I, "I can do nothing to keep your bees from taking my nectar; and if they do take it I have no redress, but must just stand it."

"That's about the size of it," said Bangs.

"See here, Bangs, I thought you said all the nectar on my place belonged to me." A curious look began to steal over Bangs' face. Pushing my advantage, I said, "It seems to me, that's a rather queer kind of property that anybody else has as much right to take as I, and I can't drive them away nor get any pay for what they take."

"Well now, I declare to goodness," said Bangs, "I hadn't never looked at it just that way before. I never had, for a fact."

"Don't worry over that, Bangs. You're not the only one who hasn't seen things straight. I think Prof. Cook was the first one I ever remember putting that matter in its true light. He doesn't agree with me; but in a convention at Chicago I heard him say, "It may as well be understood, first as last, that the man who owns the land doesn't own the nectar on it." And I think any reasonable person will admit that, if nectar is public property, there is no reason why the government may not dispose of it in any way that may be most for the public good. And if it be for the general good that bee-keeping be carried on by those who make a special business of it, then it is possibly only a matter of time when there will be no more talk about a man's moral right to his territory, but by purchase or otherwise he will have a legal right. In other words, he will own the territory needed to get a crop of honey, just as much as a man now owns the territory he needs to raise a crop of potatoes." C. C. MILLER.

Marengo, Ill., Nov. 11.

HUMBUGS AND SWINDLES.

Our readers will remember that we have frequently spoken of the swindles emanating from J. M. Bain and his aliases from Zanesville, O., or little towns adjoining. He is now receiving considerable sums of money for a new fraud, particulars of which are given in the following, which we clip from the *Rural New-Yorker* of Nov. 19:

> It appears that the unjailed bird, J. M. Bain, is back of the new swindling dodge of selling "black pepsin" for increasing the amount of butter to be churned from a given amount of cream. An extract from this scamp's letter was given last week (see page 741). It is a fraud and a humbug, a scheme well worthy of one who has robbed thousands of women by his fraudulent schemes, in the guise of plating-machines, incubators, pure-bred chickens, eggs, valuable new seeds, and other delusive temptations. The fraud has letters sent to an alleged "Chemical Co." in New York to avoid detection and make his absurd offer more plausible. To their disgrace, be it said that several agricultural papers have printed this stuff.

NOTES OF TRAVEL

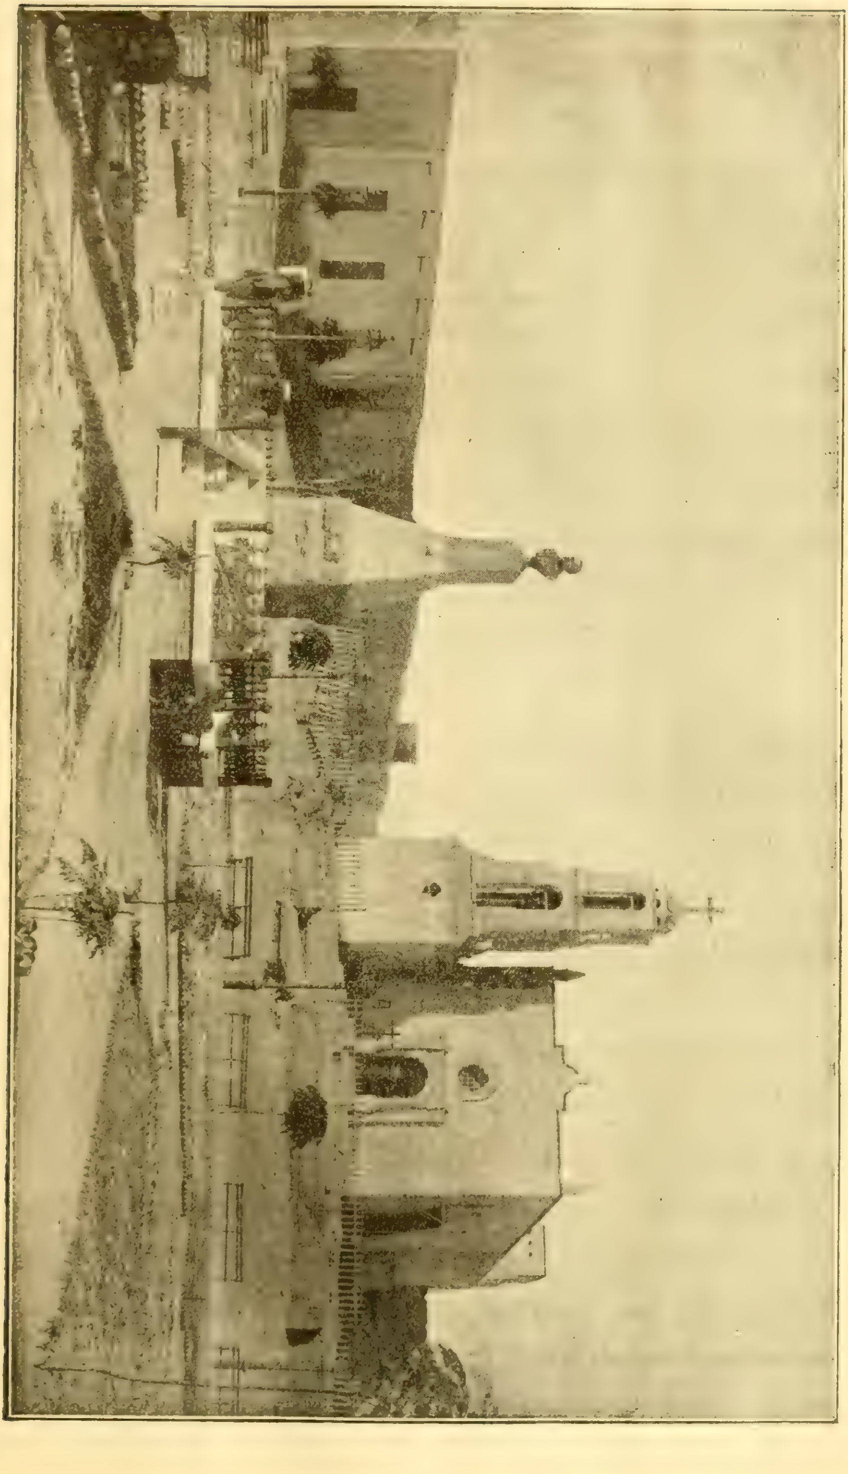
FROM A. I. ROOT.

PASO DEL NORTE.

In crossing the great bridge that separates the United States from Mexico, we were obliged to pay an extra fare of ten cents on the street-car; and in just a few minutes we were in a foreign country. One would hardly believe that simply crossing a river like the Rio Grande —a river which is many times not a river but only a dry gravelly bed—as I have said, one would hardly believe it possible to find the change we meet in going from El Paso to Paso del Norte. The people are different and the buildings are different. It is true, we meet many Mexicans, Spaniards, and Indians in El Paso; but across the river the people are all alike unless it be an occasional visitor of the American type. The Mexicans seem to be a quiet, inoffensive, and peaceable folk. As there are many visitors we find fruit-stands and curiosity stands at almost every turn. In fact, in this mild climate these little stands for traffic and trade stand outdoors the year round. Things are very cheap in Mexico, and pennies are in common circulation. In the way of eatables you can get more for a penny of almost any thing than you want. Perhaps one reason for the latter fact is that, as you pass along with your cakes or pies in your hand, a glimpse into the dwellings, with the doors wide open, makes you fear that some of the dust and dirt may have got kneaded into the cakes. At one place a Mexican was supplying a hungry crowd with chunks of something from a great dish-pan. It was probably pieces of sweet potato, or yam, fried in fat of some kind. They passed in their pennies, and he cut off slices which they took in their greasy fingers. While we were thinking of sampling this delicious luxury —at least the people seemed to think it so—the vender noticed some crumbs of the potato sticking to his big knife. Without a bit of hesitation he licked his knife clean with his tongue, and then went on in a very businesslike way slicing off more for the people. Mrs. Root took umbrage at this proceeding, and not only refused to make a purchase, but she would not buy their candy, cakes, nor any thing else, until we got across the river into Uncle Sam's domain once more.

On the adjoining page I have given you a picture of one of the oldest churches in America. But I am not ready to take a look at the church just yet. I want you to notice the dwellings at the left hand of the picture. This is a fair type of the streets and dwellings of Mexico; but they are rather finer than you find anywhere else, because they are on the street close by the old church. Please notice those sticks projecting along where we should see the eaves. I saw these all through the Mexican towns and finally I asked somebody what it meant. "Why, bless your heart," said he, "those are the eavespouts that carry the water off over the sidewalk." The roofs of the buildings are made of weeds and straw, covered with clay, or "dobe," pronounced *do-by*. They seldom have rains hard enough to wet clear through the dobe straw roof. But when there is enough rain falls these spouts sticking through the wall carry it away from the building, else it might wash out the dobe sides and dobe foundation. The floors are of the same clay, or dobe, stamped hard. I suppose the grease and dirt that get on the floor in the course of years make the floor a little harder, for that too is stamped in. These floors, however, are generally swept clean, and the dooryards are swept clean and tidy also, sometimes for quite a little distance. The abundant sweeping gives the dooryards a rather pretty-looking appearance, and then the ground is generally stamped very hard and firm all around the doorway by the abundance of children that troop about. I am glad to notice that the children are fast getting hold of the customs of the United States, and I believe they *all* go to school, although every thing seems to indicate that these people are just emerging from a sort of at least semi-heathenish state. They act much like the Indians I have described. They are backward about talking much, especially with foreigners; and when you try to talk with them, many times their swarthy faces are tinged with a blush of embarrassment. They evidently recognize us as their superiors in many things. I am inclined to think, however, that they think their religion better than any thing we have to offer.

And now about this old church, built somewhere about the year 1550. I thought I had the date in my notebook, but I can not find it. Any way, it was built so long ago that the door which you see in the shadow, on the right hand of the tower, swings on a pole instead of on hinges, as in modern times. The bottom of the pole stands in a hole made in a block of wood, and the top sticks through a hole in a piece of block above, and the door is built fast to said pole; and when you open the door the pole turns around with the door. The winding stair is worn by the tread of many feet for centuries. There are two bells in the tower—a large and a small one. The audience-room of the church is very neat and tidy. At the further end, candles are burning all day long, and priests and other officials are constantly going through some rite or ceremony. But the strangest part of it all to me was to see people going into and out of the church, apparently at every hour of the day. Some of them simply went inside and dipped a finger into a little stone tank of "holy water." With the wet finger they then made a cross on the forehead, and with bowed head they went out. Fine ladies, servant girls, business men, and even children, did the same thing. They seemed to take in the place of worship on the way to and from business. Sometimes packages of merchandise were laid down while the owners went in to pay their vows. Many of the worshipers knelt on the stone floor, and, I supposed, breathed a prayer, although I did not hear it. Others went up nearer to the lighted candles, and approached certain holy inclosures. Sometimes they went inside as they knelt in worship. As I looked on I felt moved by the spirit of the place and the people. A girl came along with some packages which she had probably purchased. She had the appearance of a girl who works out. She laid her bundles down, approached the holy water with a sober



OLD CATHOLIC CHURCH AT PASO DEL NORTE, MEXICO.

and solemn look, then she knelt, and I either saw, or imagined that I did, her lips moving in prayer. I do not know what she said, of course; but is it not possible—nay, likely—that she was honest and sincere, while something like the following passed through her mind?

"Holy Father, help me to be better than I have been. Give me grace to be more gentle and kind to the baby. Help me to be more patient, even when my mistress is unreasonable; and especially, O Holy Father, help me to overcome my growing habit of telling fibs and falsehoods. Give me courage from on high to *confess* my faults, instead of telling little lies to screen myself and creep out of them. Help me to *own up* when I have been forgetful. Help me in my efforts to avoid evil companions that I know are harmful. Help me to love more this thy holy church, and forgive all my many sins. Amen." Our stenographer suggests that he fears I have been stretching my imagination on the side of charity. Well, the truth is, that neither he nor I know just what thoughts and emotions are in the hearts of these people when they kneel in that old church where thousands have knelt before them. Of course, I should want every prayer to be made in the name of Christ, for "no man cometh unto the Father but by the Son;" but from what I know of them, this is not their way; and our stenographer again suggests that their address would more likely be made in the name of the "holy *mother*" than to the Holy Father. But even if that be true, I trust and believe that, with the large business traffic that is now opening in Pasó del Norte, with us, thoughts of God and Christ may soon be carried in; and I hope, too, that there may gradually commence a *practical* form of praying, even if they have not done it already, instead of formulated prayers and mechanical actions without heart or spirit in them.

I told Mrs. Root that I was not going away without taking some part in their religious services; perhaps she feared that I too was going to kneel and pray on that stone floor. I did not feel quite called upon to do that, however, but I did—what do you suppose? Why, I dropped a nickel into a little box that had an inscription over it, soliciting funds for the purpose of keeping up the church and its services. Some of you may think, perhaps, that civilization in its progress should tear down and obliterate this sort of religion—especially when we recall the bloodshed and crime and superstition that have been more or less attached to it in times past. Now, I can not agree with this. Of course, I know very little about the whole matter; but I should like to see that very church-building, those very services, and the same people that frequent them now, gently molded over to some practical religion. May be it can't be done, and has never been done; but I tell you, friends, the universality of Christ's religion—that good time that Habakkuk foresaw when he declared that the "knowledge of the Lord shall fill the earth as the waters cover the sea," and that Daniel foresaw when he said that the stone cut out of the mountain should fill the earth, is even now at hand—a kingdom that Christ said should stand against all the assaults of the enemy; a time when his prayer will be answered for the unity of all his people. The Endeavor Society is making a big stride in that very direction, or, at least, in a direction that will bring harmony, close acquaintanceship, and brotherly love between the members of various religious organizations we now have scattered over the world.

The walks in front of this old church, the stone edgings, and the shrubbery, give one a glimpse of Mexico. The inscriptions were all in an unknown language, so we could tell but little about them. The fine monument, with its little enclosure, in the foreground, we judge to be quite modern. Our proof-reader tells me that the inscription, seen in the photograph, reads, "*A Benito Juarez*"—"In Honor of Benito Juarez," president of Mexico.

The dogs are quite plentiful in Mexican towns and streets. Two of them you notice are even now in view. The big one at the left looks so exactly like the chap that walks over my glass sash across the way, smashing the glass at every step, that I fairly ache, every time I look at the picture, to chop off that tail of his that sticks up in the air so like a flag; only, if I could choose just where to have it cut off, I would let the ax fall just back of his ears. You will notice a goat standing in the shade of the president's monument. Goats are also quite plentiful in Mexico, and they are just as nasty there as anywhere else. The Mexican, seen with something on his head, with his shawl wrapped about him, looks like the fellow who was selling fried yams. Perhaps he is moving off to another part of the town to find a fresh lot of customers. The young trees visible, I judge to be the beautiful umbrella-tree. When they get a little larger, their beautiful foliage ranges itself toward the sun and light, almost like shingles on the roof of a house, and it is a veritable great umbrella, affording a delicious shade, which is needed in Mexico almost every day in the year

Oh! I forgot to tell you that, as we passed out of the church, we noticed some lettering on the stones under our feet, and we were informed that the former priests and officials of the church have their resting-places under these very stones, so that, while we were standing on the walk, we were really stepping over "the tombs of the prophets." The dates went back to the 15, 16, 17, and 18 hundreds.

Now, as I try to tell what we saw there I am aware that I have doubtless drawn some very erroneous conclusions. If so, I wish some reader of GLEANINGS, who is competent, would set me right. I should be especially glad to know something more of this strange religion that has scattered the ruins of these old mission churches throughout such a large part of our land—ruins that go back almost to the discovery of America by Christopher Columbus.

In many of the shops we saw beautiful specimens of Mexican onyx and Mexican filigree jewelry. This filigree jewelry is probably more artistic than any thing else in that line made in the world. Some of it is so fine that it requires a magnifying-glass to see the spiderweb wires that form the beautiful scrollwork and frostwork; and I am told that the greater part of it is made entirely by hand. The material is chemically pure silver. The shopkeepers urge visitors to buy, because of the saving of all duties and customs between foreign countries. In fact, at Paso del Norte they import laces, precious stones, and every thing in that line, from all parts of the world, free of all customs duties. "It costs you only ten cents to come over here, and ten cents to go back again, and you can save dollars by making your purchases here," urged a shopkeeper. But I insisted that we should show the goods we had purchased, and offer to pay customs, as we went back over the bridge. At this our friend put up both hands in disgust. "Why, put the goods in your pocket, and I assure you"—and he brought his hand down with emphasis—"that they will never say a word, and you will not have a bit of trouble." I tried to make him understand that that was not the point at all. If it were contrary to the laws and regulations between the two countries, I did not want the goods in my pocket, and I did not want to save the duty.

I do not know whether he belonged to the old church or not; but it was evident that his religion did not take in even a *glimpse* of any sort of such religion as I tried to explain to him.

HIGH-PRESSURE GARDENING.

BY A. I. ROOT.

VEGETABLE-GARDENING FOR DECEMBER.

The principal vegetable to raise under glass is lettuce; and I think the Grand Rapids lettuce takes the precedent now pretty much all over the United States. The biggest demand usually comes in the month of February. In some localities, perhaps it is a little later — say through March; but during February and March the demand has always, so far as I know, been beyond the supply, and a great many times very high prices are realized. During last February and March it brought from 15 to 20 cts. a lb. at wholesale, and retailed at from 30 to 40. We sold it for a nickel per ¼ lb. It was put up in little paper bags. There seems to be a general craving for green stuff just before the approach of spring, and no doubt this craving is natural, and therefore we may suppose it exercises a beneficial effect on the health.

Well, as it takes about 90 days to grow Grand Rapids lettuce to perfection, if you have not already sown your seed you want to get right at it now. The seed may be started in a box placed in a window, in some room where the temperature will be about right, and the window should be one that will afford as much sun as possible. The plants may grow in the boxes for the first four weeks. I believe the best lettuce-growers usually transplant twice. This not only makes a stronger root, but it is economy of space. Give the plant more room as fast as it needs it, and not any faster. In the latter part of January, and during Feburary, lettuce will do very well in a cold-frame. It should, however, be pretty well banked up with manure around the sides; and when the weather is very severe, a shutter or straw mat should be put over the sash. Cold-frames and hot-beds are cheaper than a greenhouse—that is, the first cost is less; but after you get to doing very much with these latter appliances you will, sooner or later, want some sort of glass structure that will permit you to get inside and work during cold or stormy days. Every one who farms, or who hires hands for working in the ground, sooner or later finds it cheaper and more convenient to hire his help by the year. In this way the man becomes accustomed to the ways, knows where things are planted, and in many ways is oftentimes worth double the price of a green hand, even though the latter has the same ability. Well, if we hire help by the year, what shall we do with them in winter time or during stormy days in spring and fall? And this is just where a greenhouse comes in. How shall we made a structure for this purpose cheapest?

A CHEAP WAY OF MAKING A COLD GREENHOUSE.

One of our greenhouses has been so much shaded by the new buildings, made necessary by the enlargement of our business, that I have been for some time thinking that it would have to be moved to some point where we could have every bit of the sunshine. In fact, I have never had a greenhouse in my life, until within the past ten days, where it had *all* the sun in the months of December and January, from morning till night. Now, such structures, exposed to dampness, frost, and sunshine, rot out very quickly—especially the part that comes next to the ground. Stone is expensive, and it conducts frost in a way that makes it not just the thing. How, then, shall we have our glass supported in some way that will be durable and frost-proof, to a large extent? I will tell you what I did. I purchased pine lumber, 2x6, in lengths from 20 to 30 feet long. Then I hunted up all the old iron pipe I could find, about an inch or an inch and a quarter, outside diameter. You can get discarded gaspipe in almost any collection of old iron; or if you go to the plumber's or repair shops you can almost always find second-hand pipe that can be had at a very low figure. Our long string-pieces, 2x6, are Norway pine or hemlock — something durable, and that will hold nails. With an expansion bit we bored holes in these strips about 6 feet apart. The holes are to go in the narrow way, and reach almost through the narrow stick — say to a depth of 4 inches, the holes being of such size that the pipe will drive in snug and secure. Now these iron pipes or iron stakes are to be driven into the ground. We drive them into our soil from 2½ to 4 feet, the depth depending upon how far they are to rise above the ground. You can stretch a line and drive the pipes first, and then drive your piece of timber over them afterward. Sticks supported in this way make the plates for the glass sash to rest on. For the center pieces, the pipes reach out of the ground about 4 feet; then, by sinking the paths between the beds down a foot and a half or two feet, there is no difficulty in walking all through the structure if you walk in the paths. Such a structure, containing 45 sashes, we put up last week in about four days. It is warmed by exhaust steam running in tiles back and forth under the beds. These iron pipes are the only support the building has. Around the outside of the structure we board up to the plates with some kind of cheap lumber, and something that does not rot easily — say chestnut, hemlock, or Norway pine. After boarding we banked up with dirt almost to the sills. This boarding is fastened to the iron pipes by common staples large enough to go around the pipe and clinch in the boards. In this same way we board around the beds, leaving the paths between the boarding. The main roof of the building is made of 32 sash; 4 rows of 8 each, running east and west. These 32 sashes have only a slight inclination to the south, except the extreme southern row, which comes down to the ground with quite a sharp slant; then, to get the evening and morning sun, we have a row of sash on the east and west sides, sloping down to the ground like the row on the south side; and on the north side we have a similar row; but, as there is no sun to catch with these, instead of coming clear down to the ground, the lower edge of the sash rests on a support about three feet from the ground. The structure is particularly for raising vegetable-plants; and by the first of May, or perhaps a little later, and when frosts are no longer to be feared, the sash are all to be lifted off and piled up. We have practiced this for a great many years, and we find it much more satisfactory than a greenhouse where the glass is not movable. When the sash are all stripped off, and the plants receive the full benefit of all the later summer showers, it is just a sight to see them boom.

RAISING CELERY IN WINTER TIME.

I am reminded of this matter this Thanksgiving morning by the tremendous demand there is for our White Plume and Self-blanching celery. Our stock is so nearly exhausted that we have had to put the price for the best at 15 cts. per lb., and yet the supply is not nearly equal to the demand, and never has been. This new celery culture that has been so much talked about opens a way for raising celery in winter—yes, even out of doors, and we have got one bed about 8 feet wide by 75 long, where the celery is just growing beautifully. Some of the largest might do for table use now; but it would be a pity to take it while it is less than half grown. Last night we had a temperature of only 15 above zero; but the celery is as yet unharmed. Of course, it is protected with boards all around and sash on the top. The boards are about a foot and a half wide, and we have banked dirt nearly up to the top. We are just now making preparations to supplement the dirt with coarse strawy manure. The manure will be right on the garden, where we want it, and all that leaches out will go down into the dirt and around the celery. As the bed is 8 feet wide, and the sash are only 6 feet long, a board one foot wide is laid on flat and nailed along the north side, and a similar one along the south side. These boards are nailed to strips that connect the stakes, these strips running right under the sash. With plenty of coarse strawy manure, and possibly some shutters over the sash, I think the celery can be kept in such a pit all winter. I am not sure that any glass is needed at all, covering the whole bed with boards; but as this has not grown as large as we wanted it, I thought the glass would help it to grow during nice spells in winter.

OURSELVES AND OUR NEIGHBORS.

For the flesh lusteth against the Spirit, and the Spirit against the flesh.—GAL. 5:17.

It seems a little singular, friends, that I should choose the above for my text to-day, when I can remember so vividly how I used to dislike these very words. Away back in childhood, in reading or hearing read portions of the Bible, where it spoke of "lust" and "lusteth," "Spirit," "flesh," etc., how dry and dull and unmeaning the words used to be! I used to feel very much like saying what a friend said to me in jail one Sunday afternoon when I started to open the Bible. Said he, "Mr. Root, I have got so sick of that sort of stuff that I absolutely can not bear to hear it." There was good reason in his case, however, why he should dislike any thing from the Bible just then. He was just recovering from a drunken spree, and had been giving lust full swing; and he had crushed out the Spirit or all the spirituality that he might have had in his sober moments. And now herein lies the divinity of the Bible. It is dull, dry, and unmeaning—yes, I know that by experience—to those who do not propose to listen to its pleadings. Sometimes men say, "Well, I guess after all this world is about all there is to it, any way, and for my part I am going to get just as much out of the world as I can before I die. If I run against other people, or other people's happiness, they must look out for No. 1." They do not often put in the word "happiness," but they include it all the same. Such people decide as a matter of course that there is no future, and *no God*. A God of justice would be very inconvenient to one in such a state of mind, and hence "The fool saith in his heart, there is no God."

It is only within a short time back that I have begun to comprehend fully what that word "Spirit" in the text means. In our recent Sunday-school lessons, where the Holy Ghost has been mentioned several times, I have been noticing the note in fine print at the bottom of the lesson-helps, saying that the American revisers would substitute "Holy Spirit" instead of "Holy Ghost." Now, that word "Ghost," even when the word "Holy" comes before it, and when both words are capitalized, has always been more or less repulsive to me. Since I have gotten over all my childish superstitions in regard to ghosts, and I since have, through the light of Christ Jesus, learned to fear nothing but *his* displeasure, the word ghost has had an unpleasant sound, and it brings up unpleasant recollections. If you say "Holy *Spirit*" it divests the expression of all these unpleasant recollections, and the Holy Spirit is what gives us spirituality. How I do love that word "spirituality"! In talking with some people we see that their thoughts are all about the world and worldly things. They are *all* worldly. Sometimes we say, "That woman (or man) does not seem to have a *particle* of spirituality." Sometimes I am obliged, while waiting for something, to listen to the conversation that is going on about me. A good many times it becomes my duty to entertain people. Oh how I do love to find something *spiritual* about them! How I do love to discover that it is an easy matter to lead them away from worldly things up to something higher—to something spiritual! And now for the statement of our text, "The flesh lusteth against the Spirit, and the Spirit against the flesh; and they are contrary the one to the other."

It seems a little strange, sometimes, that we as human beings should have both a spiritual nature and a fleshly nature. By the way, that word "flesh" is one that used to trouble me. The word "trouble" is not quite strong enough, however. I think I have told my good old mother that such words *disgusted* me. This was the time when I was about eighteen or twenty. I knew a great deal more then than I do now—or, at least, I *thought* I did. I used to talk "evolution" to her then, and tried to persuade her that evil would finally go out of fashion or get behind of its *own accord*. Dear me! what a doctrine! When your garden gets to growing up to weeds, and the weeds are outtopping the potatoes, suppose you excuse your farming by explaining to your friends and neighbors that, in the course of time, the weeds would diminish in vigor, and the potatoes would get ahead of them and crowd them out of existence. Wouldn't that be a bright kind of philosophy and reasoning? Why, you would call such a man an idiot. You would say to him, "My good friend, your potatoes are about ruined already. There never *can* be a good crop, and your only possible chance for even a poor excuse for a crop is to get right at it this minute, yank these big weeds out by the roots, shake off the manure and rich soil clinging to said roots, and lay the weeds down between the rows for mulch for your poor abused and long-suffering potatoes. If you get right at it now, and look sharp that not another weed gets a foothold, you may possibly have a few good potatoes. But nothing but the most prompt, earnest, and immediate effort can give you any crop at all." Just so with spiritual things and fleshly things. They are as much opposed to each other as those great weeds are opposed to potato growing. If you want to raise potatoes, the weeds must be kept down from the start. If, however, you want to raise weeds, and have made up your mind that you don't want any potatoes at all, you had better pull your potatoes up. Come to think of it, I don't believe it would make very much difference, however, whether you pull them up or not. The potatoes (although the plant is a rank grower when it has a fair chance, loving care, and kind treatment) would, under ordinary circumstances, make no headway at all against the rank common weeds. Just so with spiritual things. Spirituality will not grow in your heart without care and encouragement. Your spirituality will be dead and gone unless you look after it, water it with love and kindness, and keep the weeds from shading and crowding and choking it. Does some one say, " Well, what is the use of spirituality, any way?"? Why, spirituality is what makes us men and women in God's own image, instead of wild beasts. What a hideous thing is a wild beast! Perhaps you have seen conflicts between beasts of prey and their victims. Sometimes the victim is of such size that it and its natural enemy are pretty well matched. I have seen a dog and a woodchuck stand in about this relation to each other. The dog for a time seemed to almost fear a contest. Finally he summoned all his savage, ferocious nature. By barking, and showing his teeth, he wrought himself up to state of rage and frenzy. Then he pounced upon the poor cornered victim, and in the most savage and cruel way proceeded to tear him limb from limb. Such sights give us pain, or ought to; but they give us a glimpse of the low brute nature. People who learn to love—by the way, the word " love " is not the one after all, for it seems sacrilege to use it in that sense; but what I mean to say is this: Even men and women may develop a low taste for scenes of ferocity and bloodshed so that they look on with satisfaction in seeing one animal destroy another. Dog-fights, cock-fighting, bull-fights, and things of this class are an illustration. After they have seen an animal "drag the beating heart to light" from his victim then Satan puts it into the heart to demand that the fierce wild animal shall try his low brute nature in a contest with a human being; and where there is a chance that a *man* may be killed, instead of an animal, thousands will flock to see it. While in Paso del Norte, mentioned in another column, Mrs. Root and I visited the arena, where they hold their bull-fights. It was a cheap wooden structure, and its size indicated they did not have very large audiences. They can not have them in the United States. The Humane Society has put an end to it; but Mexico has not as yet got far enough advanced in civilization and Christianity to do the same thing. When they have these bull-fights, however, they are advertised for hundreds of miles away. The people come from the United States to see them. They always have them on *Sunday*. Isn't that a little significant? and it is point I am coming to a little further on.

Well, these things I have described are types of the lowest and most degrading order of letting flesh rule instead of the Spirit. No, no! hold on. A bull-fight does not compare in low sensuality with a prize-fight between two *men*. Isn't that true? There is not a specimen of the animal kingdom but that stands *higher up* in the scale of animals than the two men who thus consent to pound and bruise each other because the populace demand it. Why, it is often urged that these men have no unkind feelings toward each other at all, and no sort of grudge. Before the contest they are as pleasant toward each other as a couple of brothers, and it is just so after they get through. If a man were to insult you or some of the weaker members of your family, and you were to pound and bruise him, we might say there was some excuse for it; and even some Christian people might say, " Served him right." But this prize-fighting is a *cold-blooded* affair. Men bruise each other, and mar the image that God has made, with the same coolness and deliberation as that with which a butcher would put his victim to death. I suspect that it is the gambling craze that lies at the bottom of the whole of it. Satan likes to link his agencies together. When the men fight, then *other* men give loose to their unscrupulous greed to rob each other of their earnings. They take money without equivalent. It is not quite highway robbery, because both parties consent to it. The party who is robbed is not drunk with *whisky*, but he is drunk with the *gambling* craze, with a fierce passion to take the money or property that belongs to his neighbor, without equivalent. Why, what an awful thing gambling is, any way! Did you ever think of it? A young man in my employ—yes, a boy who for years sat under my teachings at one of the mission Sunday-schools, after he grew up, and while in my employ, I found he was spending all his earnings in *gambling*. I talked to him about it, and he frankly owned it up. Said I, " Why, look here, my young friend. Can you look me in the face and own up that you *wanted* to take, or were *willing* to take, or did take, the hard earnings of your comrades and friends simply because you *won it* in a game of cards?" He did not reply in words, but nodded while he cast down his eyes, as his cheek flushed somewhat with shame. " Why, could you be happy with the money in your pockets that they had worked slowly and painfully for during past weeks and months? Is it possible that, in this enlightened and intelligent country, with such a mother as you have had, and such brothers and sisters, that you could *want* the money belonging to somebody else, without working for it? What has got into you?" He assented to all I had to say, and gave me a feeble sort of promise to do better. But he was in Satan's toils, and I fear he is yet. He behaved almost exactly as do those who are crazy for strong drink. In fact, the two are twin—will it be wrong if I say twin *devils* instead of twin *evils?* Well, if you are so foolish and thoughtless as to let either one of them get hold of you, you may look back some time and say, " Brother Root was right. He called the thing by its right name."

These fleshly lusts grow upon us amazingly. They extend their roots and tendrils until they get all over us; and after you think you have shaken them off, you will find the old roots and tendrils clinging there still, until it seems as if you must tear yourself to pieces to root them out and make them let go their hold. God knows that *I* know something about it, even if my most intimate friends do not suspect it.

We used to have a Jersey cow that was taught to tear down the fence around our pasture lot. The way we *taught* her to have such amazing skill with those little hooked horns of hers was by a careful system of education. No, no! I do not mean *careful*—I mean *careless*. Every time she broke out and got into the sweet corn, we patched up the fence a little better. She was young, restless, and intelligent, and she finally began to enjoy the fun of ripping up things with those sharp horns of hers as fast as we could repair the breeches with barbed wire and clinched wire nails. She soon learned to use her horns as dextrously as a carpenter would use the claw of his hammer. After she had pried out the nails sufficiently, and pulled out the staples with her horns, then she would push against the fence until she could hear something crack. Then she would work with her horns once more, then she would get her head in a hole, and lift, so as to pull the posts out. Finally she would march off with a part of the fence on her back, a good deal as Samson did when he carried off the gates of Gaza. After we got it tight all around, then she would make a tour of inspection and investigation, go clear round the whole lot, and look out the best spot to begin operations. Why, I have sometimes wished that I had a carpenter who possessed her skill and intelligence, especially in tearing things *down*. Now, what do you suppose my cow story has to do with fleshly lusts? Why, that is exactly the way fleshly lusts operate when they get the start. It is not a *cow*, mind you, that is implanted within the most of us, but it is a *ravenous wild beast*—a fierce, savage, *cruel* animal that knows no more mercy than the wildest and most ferocious tiger that ever trod the earth. Perhaps you think I am going to extremes on total depravity. Well, I get my information very near home. I have had tussles with that wild animal; yes, and I am *having* them more or less right along. But for the grace of God, what should I be and where might I not be at this moment? Now, what I want to tell you is this: That, after you have given way to fleshly lusts, like the Jersey cow they will be on the lookout for a weak spot somewhere. If you give way to *one* low depraved passion, the next one will clamor for admission also. If strong drink is your weakness, and you are where no strong drink can be had, Satan will suggest transgressing in some other way; and when one has let the bars down, so to speak, and indulgence has been granted to *one* fleshly lust, the others crowd through like a drove of wild beasts. The bars are down, the gate-keeper is trampled under foot, and, instead of a human soul created in God's own image, the spiritual part—the God part—is gone entirely. Why, we have evidences of this state of affairs every little while. Not long ago, in a neighboring town a man quarreled with his wife. He struck her a blow that *killed* her. Before he knew whether she was dead or alive, he rushed out of the house, tore down the street to where a train of cars was coming attached to a locomotive. He cast himself in front of the locomotive: and before anybody could see what he was doing, or stop him, he was a mangled corpse.

Just one other illustration of a human heart that has opened the gates toward all evil, and quenched the Godlike spirit entirely. History tells us of a certain proposed mutiny on board a vessel at sea. Before, however, they had put their plan into execution, it came out, and the ringleaders were hanged, and dropped into the sea. A writing was discovered, outlining their plan. They were first to murder the captain, and all the officers that were not in the scheme. Then they were to put to death and throw overboard the passengers, and the vessel was to be converted into a piratical craft. Now bear with me while I mention just one other clause in that hellish compact. The women were also to be put to death except such as they considered fit for their purpose. After a time these were to be put to death also. There you have it, friends, the whole picture of a human heart given over to fleshly lusts, and yet quite a number on board that ship volunteered, and signed an oath to go into this hideous work. The ringleader of the plot was the son of respectable parents in good standing, and he had had at least a respectable bringing-up. You see, these crimes go hand in hand. When a man consents to one of them Satan says, "Here, you might just as well give free rein in other directions as in this one, after you have enlisted in my service."

Now, dear friends, where is the remedy? Why, it is right before us in our text. The influences of the Holy Spirit in the heart of man are constantly rebuking, checking, and holding back these low animal cravings. When God breathed into man the breath of life, he gave him his spirituality. "Behold the Lamb of God that taketh away the sin of the world."

GLEANINGS IN BEE CULTURE
A Journal Devoted to Bees and Honey and Home Interests.
Illustrated Semi-Monthly
36 Pages 7×10
$1.00 Per Year

My brethren, count it all joy when ye fall into divers temptations.—JAMES 1:2.

WE have on hand already orders for seven carloads of goods for 1893, and a prospect of more coming in before the 1st of January.

IF you are expecting to go to California to keep bees, or run a fruit-ranch, be sure to read Rambler's article in this issue. Read it anyhow.

THE North American Bee-keepers' Association will hold its annual meeting in Washington, D. C., on Dec. 27, 28, and 29. This time has been set to take advantage of the usual holiday railroad rates. Further particulars will be given in next issue.

WE have just received a correction to be made in W. T. Falconer's advertisement, appearing on the last page of the cover. As the correction came too late, we will here state that their price, $2.50 per 1000, applies to 4¼ sections, 1 15/16 only. When this stock is sold out, the regular prices will take effect.

PROF. COOK says, in the *American Bee Journal*, that most if not all of the States have well-equipped laboratories in connection with their experiment stations, where analyses of all suspected honeys can be made free of charge. This, as he says, would make it easy for any one to investigate any suspected sample.

THE last *Review*, containing the sugar-honey symposium, is at hand. As nearly as we can gather, nearly all the writers, while they do not actually condemn the practice, confess to some anxiety as to the bad consequences that *may* result from its agitation. Perhaps none such will ever come; if so, no one will be more pleased than we.

IT is one thing to *court* honest criticism, and another to accept it as *honest* when rendered; many are capable of the first, but few are equal to the second. Mr. Hutchinson is one of the few who are capable of both. Although GLEANINGS has criticised, almost severely, the policy of the *Review* on the sugar-honey question, its editor accepts it in a kindly spirit, and as an honest expression of difference of opinion—just what we want it to be—although one less fair might try to construe it as the pessimistic wrangling of a rival.

NOW that the date of the national convention at Washington has been settled (Dec. 27 to 29), many of us will be wondering what the best route will be for us to take. In talking with a prominent railroad man—one who has no ax to grind—he recommended the bee-keepers to the Pennsylvania lines west of Pittsburg, and to the Pennsylvania Railroad east of Pittsburg as the best and most accessible route to Washington. We can leave St. Louis, Chicago, Indianapolis, Cincinnati, Toledo, and Cleveland, so as to arrive in Pittsburg on the morning of the 26th. From this point, if we do not get together before, we can go in a body to Washington, and have a chance to pass over the Pennsylvania Railroad by daylight, see the famous Horseshoe Curve, and the beautiful Susquehanna and Juniata Rivers. "A. I." himself expects to be one of the crowd.

ALONG with the Langstroth Reminiscences we present a full-figure view of the "grand old man" as he now appears in his latter days. The half-tone is copied from a picture taken by a bee-keeper and amateur photographer, who, seeing Mr. Langstroth in a park near his home in Dayton, O., took a shot. The artist, if we remember correctly, was a Mr. Reynolds, of Dayton, and we hereby acknowledge our thanks. Although the picture was taken nearly two years ago, it shows our much respected friend and benefactor exactly as he is to-day. In our next issue we will show a handsome bust picture, taken when he was in the prime of his life—one large enough to be framed. By the way, we hope these Reminiscences and portraits will remind some of the friends who look on that kindly face, of their forgotten self-assumed obligation—that annuity fund.

FEEDING BEES SUGAR TO MAKE HONEY.

PERHAPS there is not much need of any thing more being said on this subject; but a point occurs to me here which serves to show how incongruous is the whole thing. Bee-keepers all over our land have been feeding sugar syrup for winter stores ever since the first bee-journal was published. If this sugar syrup remains very long in the combs it is almost sure to granulate, and different substances have been used to prevent this granulation; and our veteran friend Doolittle has given us the very best remedy for said granulation; namely, adding a small quantity of *real* honey. Now, if sugar syrup, after being fed to bees, becomes honey, what an absurdity to think of adding *real* honey to something that is *already* real honey! Once in a great while there may be trouble from *real* honey candying in the cells. This is very rare compared with the difficulties we have with sugar syrup turning back to dry sugar so it rattles out of the combs. Just one thing more: In that report about the forty students, it is stated that they were unable to detect the sugar syrup from basswood and clover honey. If this meets the eye of any of those forty students, I wish they would stand up and tell us if it were really true that they could not tell *basswood* honey from sugar syrup after it had been fed to the bees. The strong aromatic flavor of basswood is so well known and universally recognized that it does not seem possible that *anybody* could taste one and then the other, and pronounce them alike in any respect. Isn't there some mistake? A. I. R.

ADULTERATING HONEY—IS IT PRACTICED? IF SO, WHAT SHALL WE DO ABOUT IT?

IN the *American Bee Journal* for Nov. 17, Prof. Cook has an able article in which he shows the extent to which honey is adulterated. As chemists are now able to successfully detect all sorts of honey mixtures, he urges that our States adopt good laws, such as, for instance, Michigan has. In his opinion, the National Bee-keepers' Union is just the organization to enforce them, because good laws will not enforce themselves. Under the very able management of Mr. Newman, and with a modified constitution, he thinks the Union could make things lively. In the next *American Bee Journal* Mr. Newman replies. So far, he says, not one of the members of the Union has asked to have the organization reorganized.

Right here may we suggest that people generally will not express themselves unless given an opportunity to vote. If the General Manager would state, in a circular letter, the desirability of having the constitution changed, and submit to them a voting blank, which they could return, we feel sure that every one would ask for the change.

But to return: The present General Manager, on account of ill health, feels that he is unable to assume such added responsibility. It would need a younger man, he thinks—one full of vigor and push. Mr. Newman is *the* man, but if he is not available we would recommend some bee-keeper who is also a lawyer and legislator—such a person, for instance, as R. L. Taylor. With a Bee-keepers' Union of 5000 members, its chief could be salaried, and yet have necessary funds for carrying on the work of securing evidence, and arresting and prosecuting the guilty parties. But how about the membership? We feel that a very large number of our own subscribers (and this will be true of the constituency of other bee-papers) would fill a membership blank and plank down a dollar if a return envelope were placed before them.

The reason, we think, why there has not been a more hearty response before is because we have not yet given those who are *diffident* about writing, an opportunity to express themselves. At any rate, it would not cost a great deal to try the experiment. Out of our over ten thousand paid-up subscribers, to every one of whom we would submit blanks, we feel pretty sure we could get pretty close on to 2000 who would become members of that organization. The present Union does not offer enough substantial benefits to make the mass of bee-keepers feel the *necessity* of enrolling their names. But a Union that could not only defend them against disagreeable neighbors, but could also ferret out and carry on successfully prosecutions against adulterators—in fact, champion the rights of bee-keepers in all things, would offer sufficient inducements to call out a large support from bee-keepers. We should like to hear from our prominent contributors, for next issue, as well as from the General Manager through the *American Bee Journal*. There is yet time enough for us to get the matter in such shape that it can be presented before the national association at Washington.

THE WIRING OF FRAMES—TO WHAT EXTENT IS IT PRACTICED?

THERE has been considerable discussion of late, particularly in Canada, as to the advisability of wiring frames. Some have gone so far as to hold that very little of it is done now by practical bee-keepers. It so happens that we supply all the tinned wire used in this country, a large part of it in Canada, and in Australia, the manufacturers of that article not caring to job to more than one house. We find, by looking over our books, that we sold, last season, over two tons of No. 30 tinned wire, and that during a very poor year for bee-keepers. It takes anywhere from 6 to 10 ounces of wire for a hundred brood-frames, and this goes to show that anywhere from 700,000 to about 1,000,000 *brood-frames were wired during the last season;* and in a fairly good year it will not be unreasonable to suppose that the number would reach fully 1,500,000. From these figures it is pretty evident that the great majority of intelligent bee-keepers practice wiring, notwithstanding a few prominent bee-keepers argue that it is a useless expense and a waste of time. We have heard this argued soberly in conventions; and one or two, we remember, seemed to think it conclusive that wiring was unnecessary, simply because they never had a comb break down in moving bees nor in extracting. It is well to remember that "one swallow does not make a summer;" and it should also be remembered that colonies on fixed frames, with combs wired, can be handled much more rapidly than colonies on loose frames *not* wired. The expense of wiring 100 frames, if it is done at odd hours when the bee-keeper can not do much else, is about 10 cts. per 100. The expense of a few broken-down combs, meaning loss of bees and loss of time in fixing up in the busy season, to say nothing of the extra caution in handling the whole apiary on wired combs, more than pays for the expense of having every comb in the yard wired.

HONEY NOT GRANULATING NOT NECESSARILY ADULTERATED.

SOME of the friends have of late been sending us samples of honey which they assume to be adulterated, and ask that we commence proceedings against the guilty parties at once. With one or two exceptions we have pronounced all such to be strictly pure, genuine product from the flowers. One sample sent in, of beautiful thick clover honey, having a trace of basswood, was as clear as crystal. It had been standing on the shelf something over a year, and our correspondent thought that, as it had remained uncandied, it must, of course, be adulterated with glucose. The honey was so thick and thoroughly ripened that it did just what it ought to do—remain liquid. We have had samples of basswood and clover honey remain clear for three years, and yet we knew the goods to be strictly pure. The fact that honey remains liquid for a year or so is no sure evidence that it is adulterated, and we regret that, through the agency of honey-labels, the impression is conveyed that, unless the honey does granulate, it is not pure. It is a fact, however, that, when it does candy, it is pretty good evidence that it is pure; but it does not by any means follow that, when it does not do so, it is adulterated. It is well known that pure California sage honey isn't apt to candy at all. Now, while we are discussing ways and means for putting down adulteration, let us not go to the other extreme of calling a good many samples glucosed, and so, very possibly, place a ban upon the honesty of reputable bee-keepers and dealers.

COMMISSION MEN AND THEIR RELATION TO THE HONEY-PRODUCER IN THE FIGHT AGAINST ADULTERATION.

WE have received excellent reports in regard to the manner in which S. T. Fish & Co., commission merchants of Chicago, treat their patrons. Of all the commission houses in the West, we believe none are working more diligently for the suppression of all kinds of adulteration in honey than S. T. Fish & Co. They realize, as does every commission house, that adulteration does harm, not only to the bee-keeper, but to the seller of pure honey. One of their salesmen, at the Chicago convention, proposed that every commission house that quotes prices of honey in the bee-journals be requested to make an affidavit to the editors of the bee-journals, to the effect that they furnish only pure honey, and that the names of such houses furnishing such affidavits be published before the bee-keeping world. The only objection we see to this is, as was also suggested at the convention, that men are so dishonest as to adulterate would also be dishonest enough to furnish a false affidavit. While we do not believe that the commission men who quote prices in GLEANINGS would refuse to furnish us affidavits, as above, yet at the same time they might feel as if their name and reputation would be worth more than all the affidavits that could be produced. However, we should be glad to receive responses from all the honey-sellers who will be willing to work with us, and, in fact, with all the publishers of bee-papers, for the suppression of adulteration in honey, and at the same time furnish such evidence as may be in their possession, of persons adulterating, or place where the same is practiced. The source of such information would, of course, be held in strict confidence by us.

We feel thoroughly impressed with the belief that producers, honest honey-buyers, and honey-sellers should combine together in a union so as to fight successfully the common enemy. Such an organization might do nothing more than this: Prove that but little or no adulteration was practiced. At all events, the mere fact of such an organization being in existence would go a long way in preventing both those who contemplate adulterating from doing so, and those who have in the past been engaged to a greater or less extent in the business, from continuing in it. We have many good laws that rarely if ever need to be enforced; but it is necessary to have them on the statute-book, simply because of their *moral force.*

IT IS NOT GOOD THAT MAN SHOULD BE ALONE. —GEN. 2: 18.

AT the end of one of Dr. Miller's Straws, on page 795, he exhorts Bro. Wilder to look up a wife, etc. This thing has been on my conscience for some time. When I read of the lonely ranches where bee-men stay year in and year out, without a woman in the house or out around the house, it really troubles me. I remember the lonely ranches I visited. I remember the sad and lonely attempts that some of the bee-keeping brethren were making, and perhaps are making, at housekeeping. Now, please do not understand me as saying that I have any thing to complain of. Many of these bachelor ranches were neat and tidy. Money enough had been expended—yes, and more too—but yet the place was not a home. I just wonder how these poor fellows can stand it to live so. If there is anybody in the world who might be expected to get weary of life, and think of taking the life that God gave them, it seems to me it would be these people who think themselves obliged to live amid such surroundings. Again and again in California, Arizona, and other western places, we approached something that looked like a home. When we got nearer, the symptoms I had learned to dread became more and more painfully apparent. No matter how much money is expended, there seemed to be a listless air of death about the whole surroundings. It was a *shadow* of a home without the *substance.* The life had departed, or else had never been there at all. A *woman's* touch was wanting. Now, friends, it is wrong and it is wicked.* There are thousands of women living alone, with comparatively nothing to do. If you live and die that way, it is just committing a sort of wholesale suicide; for what would be the result if all men followed your example? Yes, Bro. Wilder, and all the other brethren, clear through from A down to Z, for heaven's sake look up some good woman who will be glad of the chance, and let her bring life and animation into that lonely, deserted home of yours. Do not let that deathlike stillness hang over the place you call *home* an hour longer. Remember that Bro. Root himself said it was not right, and God himself said it too, when the human family was first inaugurated: "And the *Lord God* said, It is not good that man should be alone."

---

*If our Chinese brethren insist and persist in living after that fashion when they come to our shores, let them do it—no, no! I wouldn't *let* them do it. I would tell them that, unless they bring their wives and children, like white folks, they can not set foot on our shores; and then either make them go back or send by next ship for Mrs. "John Chinaman" to come along and bring the *children.*—A. I. R.

FACILITIES?

Look where you will, there's no bicycle plant so grandly complete as the one devoted exclusively to the manufacture of Victor Bicycles.

For years the work has gone on—and still at it—of making a model home for the best bicycles the world ever saw.

No other bicycle plant compares with this one, as no other bicycle compares with the Victor—or is ever likely to.

Victor catalog for the asking.

OVERMAN WHEEL CO.

SPRINGFIELD BRANCH: 128 WORTHINGTON ST.

THAT'S IT.

BEE-HIVES, SECTIONS, ETC.

We make the best goods and sell them cheap. Our Sections are far the best on the market. Our Works turn out the most goods of any factory in the world. Our goods are known as the best throughout the United States and Europe. Write for free, illustrated catalogue and price list.

SPECIAL NOTICES.

NEVADA COMB HONEY.

Scarcely a month has past since the carload arrived, and at this writing it is over half gone. If any of our readers desire to secure any of it they will need to apply early. See last issue for description and price.

CHOICE EXTRACTED HONEY.

We have a little nice extracted honey in 60-lb. cans at 10 cts. per lb. We have also secured five or six kegs (160 lbs. each) of very nice basswood extracted, that we can sell at 9 cts. per lb. There is still seven or eight hundred pounds of choice clover extracted left at Massena Springs, N. Y., which we offer at 9 cts., cans to be returned.

DAMAGED QUINBYS ALL SOLD.

Orders are still coming in for the damaged books mentioned a month ago. The "Quinby's New Bee-keeping" that were damaged are all sold; but we have plenty of the perfect copies at $1.50, postpaid. We still have a good supply of the slightly damaged Christian's Secret of a Happy Life at 15 cts. each, postpaid, or 10 cts. if sent with other goods by freight or express.

EXTRA EARLY AMERICAN PEARL ONION SEED.

We have finally, at this late date, succeeded in getting 5 lbs. of this seed that has been called for so much; but it is very scarce, and consequently very high. The best figures we can give will be as follows so long as it lasts: ¼ ounce, 15 cts.; ounce, 50 cts.; ½ lb., $3.00; 1 lb., $5.50. The above prices include postage. Our experiment last season, of starting the plants in the cold-frame, was a success, although, owing to the great wetness after they were put out in the fields, we did not get as many nice onions as we have heretofore, nor did they mature as early, nor get to be quite as large as those from sets planted the fall before. As many were unable to get sets, however, the next best thing for them to do is to buy the seeds, as above.

ROOT'S COMB FOUNDATION.

In connection with the announcement of special prices on sections in last number, we spoke of the fact of our greatly improving the quality of goods of our manufacture. This is especially true of comb foundation. Dadant's foundation has an enviable reputation, and the manufacturers deserve credit for the high standard of excellence they have set. We desire to say, however, the foundation we are now making is equal in every respect to Dadant's; in fact, we are "conceited" enough to think that it is, in some respects, superior. Here is a testimonial, just received in the mail as I write this, which is quite a surprise, unsolicited and unexpected:

> I can get goods cheaper in Chicago, but they do not keep the new style of separators, and I like your foundation better. It seems to me that your light brood does not buckle as much as Dadant's medium brood. I had some very nice combs built on your foundation the past season.
>
> Bishop Hill, Ill., Nov. 25. D. LINDBECK.

We should like the privilege of showing you how nice our foundation is, by sending you a sample, which we shall be pleased to send free on request. We do not hesitate, too, to "guarantee every inch of our foundation equal to the sample in every respect." We are just filling one order from a western dealer for *twenty-four hundred pounds*, besides a number of others not so large. As we run our mills by steam power, we can certainly make it as cheaply as any one. Write for samples; and if you can use 200 lbs. or over, ask for dealers' prices.

THE SUNDAY-SCHOOL TIMES.

Doubtless most if not all of our readers know what a Sunday-school is. You may also know of the *Sunday-School Times*, a most excellent 16-page weekly for Sunday-school workers, published in Philadelphia, Pa., at $1.50 per annum, but which we are able to club with GLEANINGS at $1.75 for the two, and both mailed from this office. The year begins this month, and you who wish to take advantage of this offer should lose no time in sending us your orders.

THE GOLDEN RULE.

Probably not all of our readers are as familiar with the Young People's Society of Christian Endeavor, which has been referred to occasionally in the Home talks of the senior editor. I take it that most of you do know of it, not only from reading your papers, but from contact with it in your church. To those who do not know of it I will say that you will do well to address the United Society of C. E., 50 Bromfield St., Boston, Mass., for Christian Endeavor literature, for I can assure you it is fully as important in the work of the church as the Sunday-school itself. There is also a weekly paper published for Christian Endeavor workers, called the *Golden Rule*, at 47 Franklin St., Boston, and this brings me to the subjcect of this notice. I can not give you an adequate idea of the value of this paper. Drop a postal to the above address for a sample copy, and examine it for yourself. It claims to be only 16 pages, but they have given twenty and over for several months, and from all appearances they will keep it up. It contains each week, among other very excellent things, thrilling letters from F. E. Clark, D. D., founder of the Christian Endeavor society, who is now on a trip around the world in the interest of Christian Endeavor. The regular price of the paper is $2.00 a year. We are able to offer it clubbed with GLEANINGS, one year each, for $2.00 only. New subscribers to either for 1893 will receive the remainder of this year free. In ordering, be kind enough to state whether you are a new subscriber or renewal to the *Golden Rule*, which now has about 100,000 subscribers. It is so good, however, that we wish it might have twice the number.

THE NEW TOMATO BOOK.

Among the many pleasant notices we have received from the press, we select the following from the *American Agriculturist:*

TOMATO CULTURE.—In three parts. Part First—Tomato Culture in the South. Part Second—Tomato Culture, Especially for Canning-Factories. Part Third.—Plant-Growing for Market, and High-Pressure Gardening in General. A Practical Book for those who work under either Glass or Cloth as a Protection from Frost. By J. W. Day, D. Cummins, and A. I. Root. Medina: A. I. Root, 1892. 135 pp., il., 16mo, paper

The first part of this industrial book is written by an exceedingly practical Southern planter, who works in the fields among his men, and shows them how by working himself. J. W. Day has made a practical success of hot-beds and cold-frames covered with cotton cloth instead of glass, in which to start the plants for the hundreds of acres of tomatoes he raises yearly for the Chicago market. The second part is written by an equally practical Northern grower of tomatoes, D. Cummins, who successfully heats his plant-beds with steam sent through drain tiles. The third part, telling how to support a family on one-fourth acre of ground, is written by A. I. Root, who claims relationship with every boy who raises popcorn, chickens, honey, strawberries, or tomatoes, and thinks that, when our great nation of people can offer the boys encouragement in the way of good prices, we shall be on the road to better things. He praises especially those boys who go into the fields and work for themselves under God's clear sky instead of hanging around the factories, begging for a chance to be "bossed." The raising of lettuce and onions, and the marketing of garden crops, is fully treated. Sold by Orange Judd Company. Price, postpaid, 40 cents.

CALIFORNIANS, ATTENTION.

We have completed arrangements with the firm of G. G. Wickson & Co., who do business both in Los Angeles and San Francisco, to keep a general stock of our supplies at both places for the convenience of California bee-keepers. We expect, by Jan. 1st, to send a carload to each point. We can not, of course, send a full line of every thing we advertise in our catalogue, but will send a good general line, including comb foundation and foundation-mills; Novice and Cowan extractors, 2, 4, and 6 frame; 8-frame Dovetailed hives; sections, 1⅞, 1¾, and 7 to foot, and many things too numerous to mention. We commend our California customers to this firm; and as soon as you read this, if you will at once sit down and write to them, naming the list of goods you are likely to require, they will thus be enabled to get what you need, including all odd-sized things that could not be well kept in stock. Your prompt attention to this will not only assist them, but be a great benefit to you.

RENO, NEV., AND VICINITY.

Our friends in and around Reno, Nev., will do well to write to W. K. Ball, of Reno, with a list of their needs in the line of bee-keepers' supplies. We are just loading a car of Dovetailed hives and sections for hives which he writes are all sold, and he will want another car when this one arrives. Let him know what you need, that he may get it for you in his next carload.

OREGON AND WASHINGTON.

Bee-keepers in these States should write to F. L. Posson & Son, Portland, Oreg., for price list of bee-keepers' supplies. We are just loading for them two carloads of supplies, comprising a good general line, and including over a ton of comb foundation. Considering the high freights in less than carload lots, you can do better by dealing with them direct than to send us your orders.

BEE-KEEPERS OF MARYLAND AND DELAWARE,

and those easily reached from Baltimore, will please take note that we have arranged for the sale of our supplies in that territory with the Baltimore Farm Implement Co., of Baltimore, Md., and now have an order for a carload to be sent to them. Write them, with a list of your requirements for the coming season.

OTHER DEALERS.

Our friends in Central and Eastern New York and New England will bear in mind that we have quite a full line of supplies on hand at Syracuse, N. Y., with F. A. Salisbury in charge. He will be pleased to hear from you.

Those in the vicinity of Des Moines, Iowa, hardly need reminding that a full line of our supplies is kept there by Jos. Nysewander, and we shall be loading a car for that point within a few days.

The bee-keepers of Colorado can obtain our supplies from Barteldes & Co., of Denver, who keep quite a full line, and issue a price list which they will be pleased to mail on application.

Later on we may announce the names of other dealers in other localities where you can obtain our goods without sending so far.

RENEW EARLY.

The time is near at hand when the paid subscription of many of our readers will expire. Probably none of you like to be in arrears any better than we like to have you. As an inducement for you to act promptly, and send in your renewals before the time expires for which you have paid, we offer you the choice of the following premiums. Now, please note carefully the conditions on which we make this offer. Those who are in arrears can not claim a premium till they first pay up; then, if they remit for a year in advance, they may for that claim a premium. The premium must be claimed when the subscription is sent; it can not be allowed afterward. Postage for mailing, and full subscription of $1.00, must be sent to secure the premium, and it must be sent *before* your subscription expires.

The list of premiums from which you may select:

DZIERZON'S THEORY, a pamphlet of 50 pages, in paper cover; price 10c postpaid, or sent free on above conditions. This is something that every enthusiastic lover of the honey-bee should read.

THE CHRISTIAN'S SECRET OF A HAPPY LIFE. This book should be in the hands of every one who desires to live a happy life, and who does not? It is so popular that over 50,000 have been sold since its publication a few years ago. We received from the publishers as many as 1250 in one shipment. This edition was revised and enlarged, so that the book now contains over 200 pages. Price, cloth bound, 50 cts. In paper, 25 cts. Postage extra, 8 cts. for the cloth and 6 cts. for the paper bound. A large reduction will be made in quantities. The cloth book given postpaid for two subscriptions, or the paper for one new subscrrption with your own renewal. Cloth edition given with your own renewal only, and 35c extra, with 8c postage; the paper edition for 15c extra and 5c postage. We have some slightly damaged paper edition that we will give free with your renewal and 5c for postage. If you send one new name with your renewal you may select any three premiums that we give for a renewal, being sure to include the postage; or you may retain 25c in cash for your commission.

PEABODY'S WEBSTER'S DICTIONARY. 25,000 words and phrases, and illustrated with 250 engravings; cloth bound. This is the one we have been selling for years at 15 cts. We thought we had done something wonderful when we offered so large a dictionary for 15 cts., but we are now able to sell them for a dime. Just think of it! Postage extra, 5 cts.

ONE-SYLLABLE PRIMER. 6x8; 48 pages, full of pictures; something that will always be wanted as long as there are children in our homes. Postage 3 cents.

POULTRY FOR PLEASURE AND PROFIT. 48 pages, and 20 illustrations. A complete little book of instructions. It treats of the best varieties for pleasure and profit; how to house and yard; how to manage; how to feed; diseases, incubation, etc. It is a 25-cent book; but by getting 1000 of them we can sell them for 10 cents. Postage 1 ct.

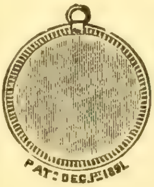
THE HORSE AND HIS DISEASES. By Dr. B. J. Kendall; 100 pages and many illustrations. Over 500,000 of these books have been sold, because they are so popular and complete, for a small handbook. It gives the symptoms of most diseases, and treatment for the same. This is another 25-cent book that we got down to a dime by taking 1000 of them. Postage 3 cts.

SILK AND THE SILKWORM. This is a complete work of instruction on silk culture, by Nellie Lincoln Rossiter, a practical silk culturist; 32 pages. Silk culture is the favorite pursuit of many ladies in our land; and all who are interested will find this little work very instructive. The price printed on it is 25 cents, but we sell them for 10 cts. Postage 1 ct.

NEW TESTAMENT, NEW VERSION. 434 pages, printed in nonpareil type. This should be in the possession of every student of the New Testament. Even if it does not come into common use, it is helpful to know what changes in translation the New Version gives. Postage 5 cts.

JOHN PLOUGHMAN'S TALKS AND PICTURES. By Charles Spurgeon; 128 pages, and a picture on almost every page. John Ploughman talks plainly, and makes a good point in every talk. It is by no means dry reading, either. Postage 3 cts.

AUGITE STOVE-MAT.



How much of domestic happiness is marred because the dishes prepared for dinner are scorched or burned! How annoying to have something boil over on the stove, as it is likely to do sometimes with the most vigilant watchfulness. All these troubles can be avoided by using the stove-mat shown herewith. We were somewhat skeptical about it till we tried it in our home, and now we are convinced that there is nothing that can lay a better claim to the term "a household necessity" The mat is made of asbestos, bound with sheet steel, crumpled around the edge, 9½ inches in diameter, and is indestructible. Though it is almost as soft as felt, it will not burn. You can place it directly on the blaze of a gasoline-stove, over the gas-jet, in the fireplace, or on the stove, and it will prevent burning of all kinds of food that ordinarily require stirring. No stirring is required for oatmeal, milk, rice, custards, blanc mange, jellies, butters, catsups, apple sauce, etc. In fact, nothing will burn on it. Coffee will not boil over if the pot is on the mat; bread toasts nicely on it. Try it and be convinced. For the nursery there is nothing equal to heat the milk and food for the baby. If a grate fire, lay the mat on the open fire. If the mat becomes soiled, do not wash or scrape, but turn the soiled part next to fire, and burn until clean. The mat regularly retails for 25 cts. We will furnish them at 20 cts. each; $2.00 per doz. By mail, 6 cts. each extra, or 65 cts. per doz. We will give one free postpaid for a new subscription to GLEANINGS, with your own renewal and $2.00.

MORE ABOUT THE STOVE-MATS.

That augite stove-mat proves to be one of the best things we have discovered in the way of household conveniences, for many a day. We have disposed of two gross in less than two months, and now have 5 gross on the way from the factory. We can make special prices in quantities of a gross or more. You ought to see the women who use it smile, and you will do so too if you will try it.

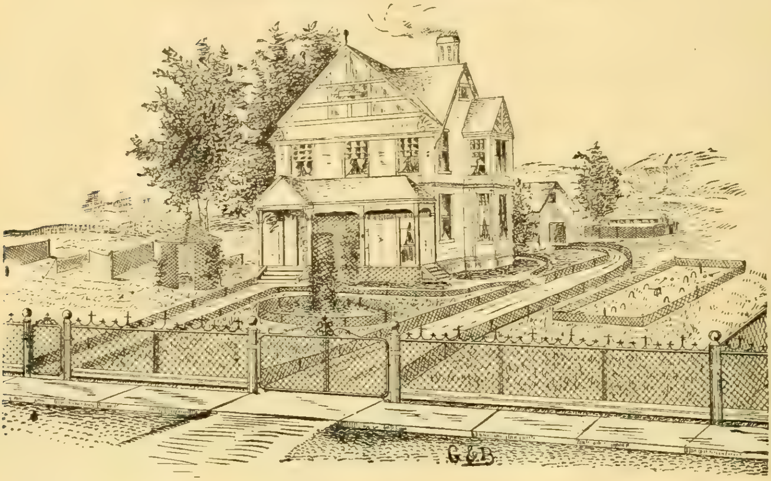
STEEL WIRE NETTING and FENCING.

GALVANIZED AFTER BEING WOVEN.



The cut above illustrates some of the many uses to which this wire netting and fencing may be put about the home. You will notice back of the house a poultry-yard. Probably the greater part of the netting heretofore sold has been used for fencing poultry, and nothing can be devised that is cheaper, better, or more durable.

It is the cheapest, costing less than 75 cts. per rod for posts, staples, and all. It will last a lifetime, and never needs repairing, because it can't get out of order. Being galvanized after it is woven, it will never rust. It is easily put up and taken down. It can not be blown down, as the wind goes right through it. On this account you don't need very heavy posts where the fence is used for poultry only. It does not keep out the light and fresh air, so needful to poultry. It is neat and ornamental, and always looks well if properly put up. It is so invisible that fowls can not see the top, and will not fly over. You can see inside as well as if there were no fence at all.

But the uses of wire netting are becoming more and more diverse. If you wish to let poultry run, and have flower-beds, or choice crops that you wish to keep from them, all you need is some of the lightest netting, not over one to two feet wide, stretched around as shown in cut above. This can be attached temporarily to light stakes, and quickly removed when desired. For holding up green peas and beans, tomatoes, and other such crops, nothing could be cheaper or more convenient than the light narrow netting, 12 or 18 inches wide. You notice, by table of prices below, that the light weight, No. 20, 2-inch mesh, is only 90c a roll, 150 ft. long, 12 in. wide. This is indestructible, and, if properly handled, can be used year after year, over and over again. You could not furnish any thing else half as good for the money; and the time of putting this up and taking care of it again after the crop is gathered is insignificant compared with sticks or brush, or any thing else that can be used.

For stock fences the heavier weights are used, or the cottage fencing, which is extra heavy and well made. There are a great many makes of netting and fencing, and it is needless to say that some are inferior to others. We still handle the G. & B. brand, the same as we have always sold since we began selling this class of goods, because we believe it to be the best value for the money of any on the market. The goods for this year are better than ever; being made of stiff steel wire it will not kink and get out of shape so easily. Our contract for the coming year enables us to make very low prices. The 3-inch mesh we are able to offer at about ⅓ less than last year, and other sizes over 10 per cent lower, or as low as we have ever been able to sell it before.

COTTAGE GATES.

There are many sizes of these gates, made with plain and ornamental top, all of which, with many other interesting things, are listed in our 28-page netting and fencing catalogue, mailed on application. Gates like above, 3 feet wide, are worth $2.70 each, 3 feet high; $2.85 for 3½ feet high, and $3.00 for 4 feet, including latch and hinges; with plain top, 30c each less. We do not keep these in stock, but ship from New York or Chicago. This is also true of most of the netting and fencing listed below. We have in stock at Medina all widths of 2-inch No. 19. Everything else listed below will be shipped from New York or Chicago.

We are prepared to make special low prices to dealers, and those who buy in large quantities. On goods shipped from New York or Chicago we must add 25 cts. for cartage on each shipment, large or small. When you pick out from the table what you want, and deduct the discount for quantity, if 5 rolls or more are ordered, then add 25 cents for cartage. The following table gives our net price per roll of all sizes, in lots of from 1 to 5 rolls. On orders for 5 rolls, deduct 5 per cent; 10 rolls, 10 per cent; 25 rolls or more, 15 per cent. Less than full rolls or parts of rolls cost double the full roll price, because of trouble of unrolling, measuring, etc. Always order full rolls if possible.

—Size—		Price 1 roll 150 ft. long and fol'wing widths.

HONEY COLUMN.

CITY MARKETS.

ALBANY.—*Honey.*—We have received up to date 328 cases of comb, and 225 bbls., kegs, and tin packages of extracted honey, and have but a very small stock of either at present on hand. After the holidays the demand for comb honey usually drops right off, and extracted begins to move freely; but this season extracted began to sell early; and at present, stock on hand is already quite small, which would indicate higher prices later on. Comb, selling slowly at 14@16 for white clover; 9@10 for buckwheat. Large sections, 1c per lb. less. Extracted, light, 8@9; dark, 7@8.

Dec. 10. CHAS. MCCULLOCH & CO.,
393-397 Broadway, Albany, N. Y.

NEW YORK.—*Honey.*—Demand for comb honey slacking off a little; supply sufficient for demand. We quote as follows: 1-lb., fancy, 15@17; fair, 12@14; 2-lb., fancy, 13@14; fair, 10@12; 1-lb. buckwheat, 10@11; 2-lb., 9. Extracted, clover and basswood, 8@9; buckwheat, 6@7; Southern, per gal., 68@75. *Beeswax*, 26@28.

CHAS. ISRAEL & BROS.,
Dec. 8. 110 Hudson St., New York.

BOSTON.—*Honey.*—Comb honey is selling slow—very much slower than we like to have it; and it is our experience that, when we start honey at a high price, it sells hard right through the season. We quote you our market nominally, at 17@18c for best white honey, 1-lb. sections. Extracted, 8@9.

Beeswax.—None on hand.

BLAKE & RIPLEY,
Dec. 9. Boston, Mass.

KANSAS CITY.—*Honey.*—The demand is fair for comb, and good for extracted. We quote: Comb, 1-lb., white, 16@17; amber, 12@15; extracted, white, 7½; amber, 5@6. *Beeswax*, 22@25.

CLEMONS-MASON COM. CO.,
Dec. 8. Kansas City, Mo.

NEW YORK.—*Honey.*—Fair demand for choice clover, 1-lb., at 14@15; 2-lb., 13@14. Buckwheat 1-lb. paper caps wanted. Buckwheat selling at 9@10½, according to quality and style. *Beeswax.*—There is no change.

THURBER-WHYLAND CO.,
Dec. 8. New York.

BUFFALO.—*Honey.*—Choice clover honey is selling in our market at present at 15@16; No. 2 grade, 11@13; buckwheat, 9@10, less our commission. Our market is light, and, no doubt, liberal amounts could be handled here satisfactorily.

BATTERSON & CO.,
Dec. 7. 167, 169 Scott St., Buffalo, N. Y.

CHICAGO.—*Honey.*—Arrivals are equal to the demand, and there is quite a little that is not up to good grade that sells slowly. Best white comb brings 18c. Extracted, 6@9. *Beeswax*, 22@25.

R. A. BURNETT,
Dec. 7. 161 So. Water St., Chicago, Ill

CINCINNATI.—*Honey.*—Demand is fair for extracted and comb honey, with a fair supply. Good extracted honey brings 6@8 on arrival. Best white comb honey, 14@16 in a jobbing way. *Beeswax* is in fair demand; arrivals good. It brings 22@25 for good to choice yellow on arrival.

CHAS. F. MUTH & SON,
Dec. 7. Cincinnati, O.

CLEVELAND.—*Honey.*—A No. 1 white honey in 1-lb. sections, 15; No. 2, 12. Market slow and well filled up. *Beeswax*, 22@24. Demand good.

REYNOLDS & WILLIAMS,
Dec. 7. 80 & 82 Broadway, Cleveland, O.

ST. LOUIS.—*Honey.*—Choice white-clover honey in 1-lb. sections is rather scarce, and selling at 17@18; good fair stock from 14@16; broken and dark, 8@10; extracted honey in barrels, from 5@6; in cans, 7@8. The indications are, that, for the next two months, honey will be in demand at full quotations.

Beeswax.—Prime stock sells readily at 24; choice selections worth 26. W. B. WESTCOTT,
Dec. 8. St. Louis, Mo.

MINNEAPOLIS.—*Honey.*—We can report to you this week a splendid market on honey. Fancy white selling at 20c; choice at 17@18. Dark at 14@15c; common broken lots, 12c. Strained, in 10-lb. kegs, 10@12c; large barrels, 8c.

Dec. 9. J. A. SHEA & CO.,
14 & 16 Hennepin Ave., Minneapolis, Minn.

DETROIT.—*Honey.*—Comb honey in fair demand. Best white, 14@15. Extracted, 8@8½. *Beeswax*, 25@26.

Dec. 8. M. H. HUNT, Bell Branch, Mich.

KANSAS CITY.—*Honey.*—Demand good, supply large. White 1-lb., 17c. Extracted, 6@8.—*Beeswax.*—None on market. HAMBLIN & BEARSS,
Dec. 7. 514 Walnut St., Kansas City, Mo.

FOR SALE.—1000 lbs. of well-ripened extracted honey in 60-lb. square cans, 2 in case. Sample by mail upon request. EZRA BAER, Dixon, Ill. 24d

FOR SALE.—Three bbls. and twelve 60-lb. cans fine Spanish-needle honey. EMIL J. BAXTER,
Nauvoo, Hancock Co., Ill.

KIND WORDS FROM OUR CUSTOMERS.

I could not do without GLEANINGS, for I have received $5.00 worth of money from it besides the good reading in the Home talks.

Deshler, Ohio, Nov. 18. THOMAS OBERLITNER.

OUR BUSHEL BOXES.

I am glad to say that those "shooks" were as good as they could be—not a poor stick in the lot. I hated to order, for fear of getting a lot of stuff not worth making up, and it gives me pleasure to compliment you—or, rather, give you your due—unsolicited.

Pittsburgh, Pa., Nov. 11. C. E. RUMSEY.

A KIND WORD FOR THE WHEEL.

I have read with much interest your article on the wheel, and can indorse all you say about it. I have used the bicycle for six years and now have my third wheel, to keep up with the improvements. My two boys have wheels also, and the way we economize time, while taking comfort, health, and pleasure, is something remarkable. I suppose the improvements will be still surprising for the next six years, and we must and will have better roads by the advent of the bicycle. W. O. SWEET.

West Mansfield, Mass., Dec. 9.

Best Articles from Best Men.

With the Dec. issue the Bee-Keepers' Review is five years old. This last number of the fifth year is unique. Its editor asked each of several of the best bee-keepers to write what he (the bee-keeper) considered *the best article he ever wrote.* Each was to go over, in his mind, the bee-keeping of the past, see how it had progressed first in this direction, then in that; met this obstacle, then that; then consider the bee-keeping of the present, its needs and necessities; and then try and give the best advice possible to give in a single article as to the course that bee-keepers ought to pursue in the future to make their pursuit more pleasant and profitable. If you wish to know in which direction the leaders in apiculture believe that bee-keepers ought to work to better their condition, send 10 cents for the Dec. Review. With it will be sent the Oct. and Nov. issues. By the way, the Nov. number gives the views of such men as Doolittle, Taylor, and Miller upon that vexed question of "Sugar-Honey Production." There will also be sent a sheet upon which are printed nearly a dozen portraits of the Review's leading correspondents (among them the editor), together with a list of all the special topics that have been discussed, the numbers in which they may be found, and the prices at which they will be sent. A proposition is also made whereby these back numbers may be secured at *half price.* The price of the Review is $1.00 a year. The Review one year and "Advanced Bee Culture," for $1.25. New subscribers for 1893 get the last three issues of this year free.

W. Z. HUTCHINSON, Flint, Mich.

Best on Earth.

More than one hundred thousand Bingham & Hetherington Honey-knives and Bee-smokers in daily use. Illustrations sent free.

Bingham & Hetherington,
Abronia, Mich. 7tfdb

FOR SALE. Nineteen colonies brown bees, in movable-frame hives. Most of them hung on improved Hoffman frames. Contain now honey enough to pay for some. Will sell for $3.00 per colony, as they stand, if taken at once.

John Davis, Gerlona City, Ark.

A NEW INVENTION in FRAMES.

No more crushing of bees, no sticking together of frames. The Hoffman frame thrown in the shade. Send a postal and learn all about this new Frame and manner of using in hives. If you want to see or learn something that will please you write to

STRAY STRAWS

FROM DR. C. C. MILLER.

MERRY CHRISTMAS!

350 MILLION people talk Chinese: 105, English: 100. Hindoo; 80, Russian; 45, German; 38, French.

A CORRESPONDENT asks what insurance companies insure bees against fire, etc. I don't know. Who does?

THE *Review* has been gathering statistics as to the queen-trade, and estimates not less than 20,000 queens sold in 1892.

GOLDEN CARNIOLANS are mentioned in *Imkers Rundschau*, with the word "humbug" occupying a very near position.

BRITISH BEE-KEEPERS are to have in London a competitive exhibition of the honey intended for the World's Fair, before it starts for this side the water.

FOR DYSENTERY, the *Medical Brief* says one of the best remedies is two or three eggs daily, beaten up lightly with or without sugar. This for people, not for bees.

A SERIES OF ARTICLES by P. Bois, on "The Science of Bee-keeping," is being published in the *B. B. J.*, and R. A. Grimshaw follows with a second series, making fun of the first.

"A NUCLEI" is something spoken of quite too often. There is no such thing, any more than there is "a women." You may have a "nucleus;" but if more than one, then they are "nuclei."

THE WASHINGTON CONVENTION is now set for Dec. 27-29; but as yet no light is given upon the one thing that some of us want light upon, so as to know whether we can afford to attend—the railroad fare.

R. MCKNIGHT was supposed to need *watching* by the Ontario Bee-keepers' Association, so they *watched* him with a valuable gold watch, "in appreciation of efficient services rendered to the association."

"SLUMGUM" is a word that I have seen used a number of times. Will you kindly tell us, Mr. Editor, what it means, and, if possible, its derivation? Is it a word that ought to go into use as a straight English word?

PROF. COOK says, *A. B. J.*, "I do not believe mating bees in confinement can ever be made a success." How can you say that, professor, in the face of successes reported? But somehow those successes were never capable of repetition.

DO YOU KNOW of any bee-keepers' terms not to be found in the dictionaries, or any that need different definition? If you will send them to me I will try to see that they are all straight in the great "Standard" dictionary soon to be issued.

CARRIE B. AARON relates, in *A. B. J.*, that she intends to keep a colony continuously at work throughout the coming winter in a heated glass balcony. Her experiments will be watched by bee-keepers with more interest than hopefulness.

A STRIKING CASE of the cure of facial neuralgia is reported by P. C. Gress, M. D., in *A. B. J.* It was effected by a single sting in the eye, and the doctor thinks if six or eight stings had been used the patient would have been killed instead of cured.

"DOES IT PAY to paint hives?" is asked in *A. B. J.* Nearly all say, "Yes;" but Messrs. Doolittle, Secor, and Cook agree with me that it is a matter of looks rather than economy. I suspect, however, that it may be economy to paint flat covers.

ENLARGING THE FIELD of the Bee-keepers' Union so as to make it include prosecutions for adulteration, if it will swell its ranks to 2000, as GLEANINGS thinks, would be a grand move in the right direction; and I shouldn't wonder if GLEANINGS is right.

A COMMON ERROR is to suppose that, in setting a weak colony in place of a strong one in order to strengthen it, it is important that the change be made when the largest number of bees are out. There will be just as much gain if the change is made at midnight.

LAYING WORKERS, Mrs. Atchley says in *A. B. J.*, sometimes commence work just about the time the queen is hatched, or a little before, then stop after the queen gets fairly down to business. On this account she thinks breeders are sometimes fooled, and send out virgin for laying queens.

ONE OF THE FRENCH bee-journals does not sacrifice clearness of meaning for brevity in selecting a name. Its name is *La Culture Rationelle des Abeilles*, or "The Rational Culture of Bees." If the full name must be given with every quotation from it, it doesn't need a copyright to prevent many extracts.

WHAT AILS the proof-reader of GLEANINGS? In last "Straws" he puts John for Jas.; and by changing the place of quotation-marks he makes me father the idea that a metal hive would be moth-proof—an idea whose credit I should not like to steal from Mr. Wykoff. Better turn off that proof-reader and get a Prohibitionist. Or were the mistakes all mine?

THAT USUALLY CHEERFUL writer, E. E. Hasty, is very blue in the *C. B. J.*, over the advance of civilization. Clean tillage leaves no fencerows for bee-plants, and the lindens are disappearing. Hurry up that short-corollaed red clover, friend Hasty, and we'll teach stock to eat melilot; and then with buckwheat and white clover we're not so desperately bad off.

"After more than 25 years' experience," says that usually careful writer, C. H. Dibbern, "we know of no other industry that offers so many opportunities to a poor man as bee-keeping to get a start in life." Some of those who are asking what other business they can unite with bee-keeping so as not to be obliged to give it up, will scratch their heads when they read that.

A neat experiment is reported by F. H. Richardson, in *A. B. J.* Into four cages, each containing a drop of honey, were turned respectively one, two, three, and four bees with empty sacs. "All quickly found their drop and began business. The two bees diminished their drop very considerably; the three cleaned theirs up very nearly; the four cleaned up and 'licked the paper;' while the one lonesome bee undoubtedly wished it had two more sacs. Now, this proved that one drop was just about three bee-loads."

LANGSTROTH'S REMINISCENCES.

EARLY PASTORAL EXPERIENCES.

The Rev. Samuel Phillips, the first pastor of the South Andover Church, served his people about sixty years. He was a man of very marked peculiarities. It is related of him, that, if any head of a family was absent from church, and he knew no cause for it, his practice was to call upon such as soon as he could, to inquire why he was absent. Perhaps this habit of his had something to do with producing that unusual punctuality in attending divine services which I think I never saw equaled anywhere else. The church records kept by him were written in a hand nearly as legible as print. In looking over his lists of baptized children I found, with scarcely an exception, that every child had a Scripture name. From one of the old men I had the following characteristic anecdote:

One morning a father presented his infant daughter for baptism. Being asked her name he replied, "Betsy."

"Betsy!" said Dr. Phillips—"Betsy! that is no Christian name; it is a heathenish name. I suppose you mean Elizabeth."

"No, sir," responded the man; "I mean Betsy."

Proceeding to administer the rite of baptism, Dr. Phillips said, in a loud voice, and with a strong emphasis on every syllable of the name, "E-liz-a-beth, I baptize thee," etc.

The father was so angry that he went stamping down the aisle with his child in his arms, crying out repeatedly in a loud voice, "This child's name, I say, is Betsy! this child's name is Betsy!"

In Dr. Phillips' time no fires were ever kindled in the church. From a large old-fashioned fireplace, in a dwellinghouse near by, the live coals were procured for the women's footstoves. No doubt, when the mercury outside was far below zero it must often have sunk inside to a very low temperature. The men could then keep their feet from freezing only by frequently stamping upon the floor; and I have been told that the noise was occasionally so great that it was next to impossible to hear the words of the preacher.

At the time of my settlement the congregation was composed very largely of farmers. There was one member of the church who came more than once to the minister to complain of the pride of his brethren and sisters. To him the strongest proof of their unchristian pride seemed to be the painted outside of their houses and the carpeted inside. One day when he came with his usual complaints I said to him, "Let me tell you a story. In ancient times there lived a philosopher by the name of Plato, who kept a large school for the instruction of the Athenian youths, and he had carpeted the floors of his academy. Now, there was an old man among his acquaintances, named Diogenes, who lived on the plainest food and in the meanest way. One day when Plato was instructing his classes, Diogenes entered with his feet all dripping with mud. Striding over the floor with great demonstrativeness, and splashing the mud as he goes upon Plato's elegant rugs, while the pupils looked on with astonishment, he cried out with a loud voice, 'Thus I trample on the pride of Plato!' The philosopher looked up, and, smiling upon him, only replied, 'But you do so with greater pride.' Then, appealing to my complaining brother, I asked him if he had never thought that perhaps he was prouder of his unpainted house and its naked floors than others were of the things which offended him so much. Perhaps for the first time he felt that he had made a mistake in being so censorious, and he actually acknowledged to his young minister that it might even be that he had as much or more pride than he had laid to the charge of others.

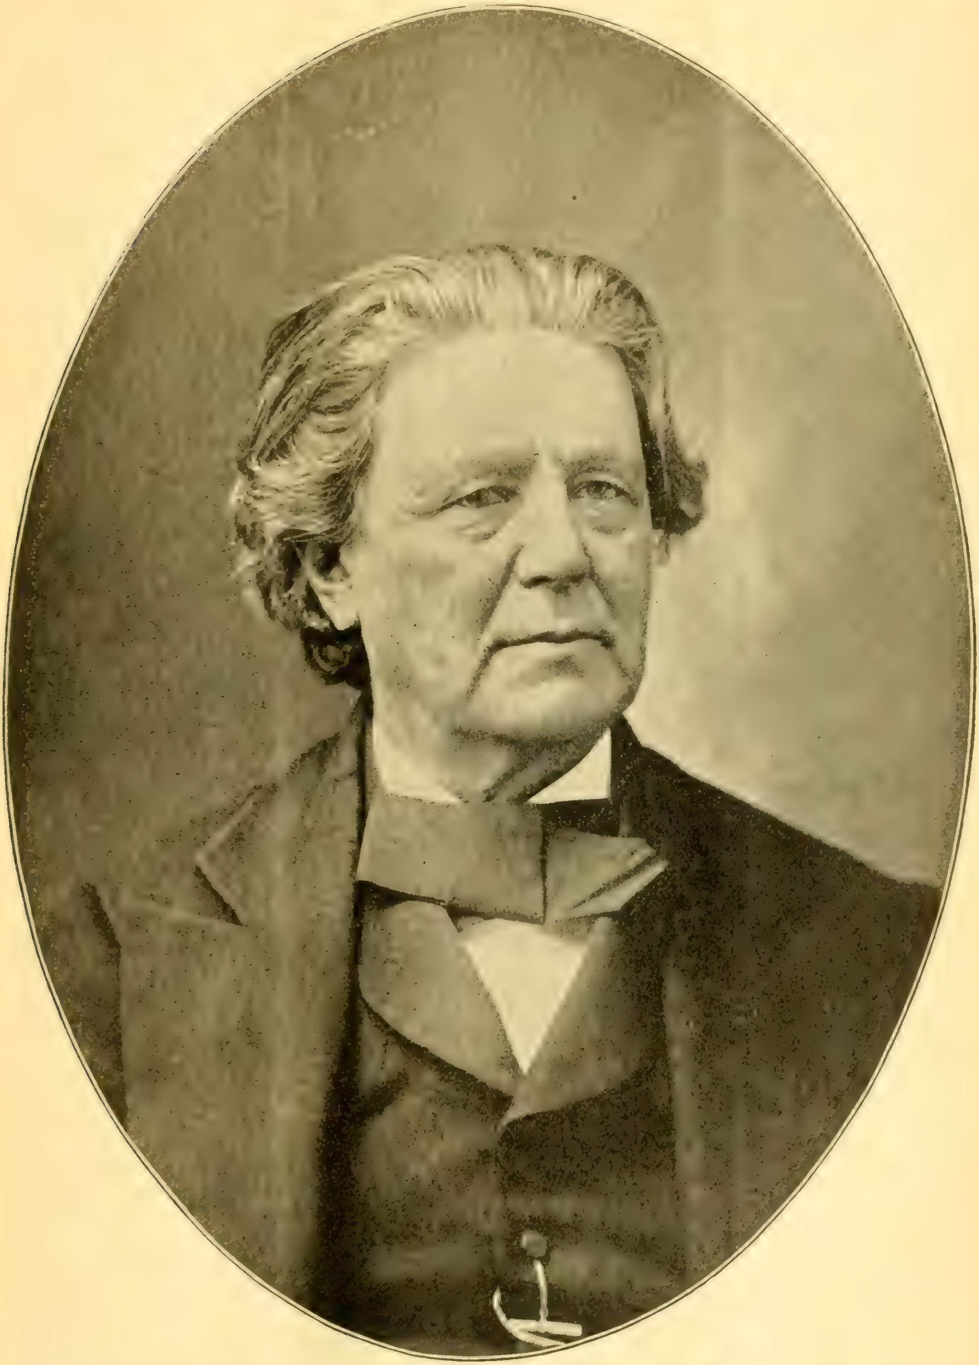
Ministers are often annoyed, especially when young, by church-members who gather up all the current scandals, seeming to think it their special duty to empty them upon him. One such person often obtruded himself upon me, in spite of my decided manifestation of unwillingness to listen to him. I at last induced him to discontinue his visits, by the following treatment: As soon as he opened his budget of evil things said and done by church-members, I turned from him and gazed intently on a corner of the ceiling, and he could get neither word nor look from me. Taking at last the hint I intended, he left me, and never came back upon similar business.

My father had two paper-mills in the vicinity of Philadelphia, which required him to keep team horses and horses for travel; so I early learned to manage a horse. But I certainly knew very little about the practical details of life. One day a carpenter was making some repairs upon my barn; and from some questions that I asked him he found out that I did not even know how to drive a nail. I knew very well that I was quite an adept in splitting boards, and first learned from him that a nail is a wedge, and how to drive it. Never having had any experience in ministerial matters, so that I could learn how a parish should be treated, I doubtless made many mistakes.

I have often thought what an admirable discipline it was for a young man, studying for the ministry, to be in the family under the eye and instruction of some able pastor who could impart to him not only theological knowledge, but that practical, common-sense way of dealing with parishioners for want of which so many pastors fail. They now go to a theological seminary and hear lectures, and learn theoretically their future duties; but often they enter upon them lamentably ignorant of what they might so easily have learned in a pastor's family.

THE SLAVERY QUESTION.

In the senior year of my college life the question of slavery became very prominent. Presi-



Yours affectionately,
L. L. Langstroth

dent Day always strongly desired its abolition, but he did not agree with many of the methods pursued by our prominent anti-slavery men. In his judgment, even the formation of anti-slavery societies in the North was a mistake. He thought their natural tendency was to irritate Southern men, and turn them away from making any practical efforts to change their institutions. I once heard him say, "If a door is partly open, and you for some reason wish to have it opened wider, it would not be wise to use such irritating language as could only end in having the door slammed in your face." I heard Wm. Lloyd Garrison lecture in a church at New Haven. Many Southern students were present, and great offense was given them by the opprobrious epithets which he so vehemently bestowed upon all slaveholders. I could easily see that their sense of justice was often violated, and that they could not fail to be provoked, by his strong denunciations of their Christian fathers and mothers. I suppose it would, at that time, have been an inconceivable idea to Mr. Garrison that "men-stealers," as he called all slaveholders, could possibly be real Christians. The cries, "It is a lie! you are a liar!" were hurled at him by those who truly believed that he deserved such epithets, and the meeting broke up, I believe, in confusion. Some years later I read, in a Portland paper, an angry controversy carried on between John Neale and Mr. Garrison, long before the latter became prominent as an anti-slavery agitator. One sentence dwelt long in my memory, and inspired a strong dislike to Garrison. The purport of it was, that Neale might live to be proud some day of the connection of his name with that of Garrison; "For" (I quote from memory) "it is my determination to make the name of William Lloyd Garrison known wherever the sun doth rise and set." To "make the name of William Lloyd Garrison known" seemed to me, for a long time, to be too much his leading motive. If it was, he lived to rise nobly above it in his subsequent career. It may well be doubted, whether the steps which led to the overthrow of slavery could ever have been taken by men who did not possess the Lutherlike spirit of Garrison and his associates. But what if he had possessed a stronger spirit of love? or if he had been, as it were, a Luther-Melancthon embodied in one soul? But God raised up a Luther and a Melancthon, but no Luther-Melancthon.

In the Andover church, as in so many others, there were wide and irreconcilable differences of opinion as to what ought to be done by church action on the slavery question. One of my own church-members came to converse with me one day, on this (to him) all-engrossing theme. We differed widely: he grew more and more excited as his voice rose higher and higher in fierce remonstrances. In a lull of the storm, a tapping was heard at my study door; and when I opened it my wife stood there with tokens of surprise if not alarm on her countenance. My angry parishioner subsided at once, and, taking her by the hand, he said, with a pleasant smile, "Did you think that I was abusing your good husband? I know I lost my temper, for which I apologize to you both; but let me assure you that, however much we differ on the question of slavery, I believe that we honestly differ, and I think that there is no man in the parish who loves your husband better than I do, or would go further to serve him."

It is by no means certain, that, if Garrison and his co-agitators had been able to obey more fully the Savior's injunction, to be "wise as serpents and harmless as doves," they ever could have brought about a peaceable solution of the slavery question. Before the war, how many wise and good men sought to prevent the sword from being drawn; and during the bloody struggle, how many cried out, in the words of the prophet, "O thou sword of the Lord, how long will it be ere thou be quiet? put up thyself into thy scabbard; rest, and be still," to be answered only by the words of the same prophet, "How can it be quiet, seeing the Lord hath given it a charge, and he hath appointed it?" Perhaps this very passage suggested to Lincoln what he said about the blood shed by the lash, and that to be shed by the sword.

In the autumn of 1856 I heard Theodore Parker preach a thanksgiving sermon in Boston, from the text, "The harvest is past, the summer is ended, and we are not saved." He gave it as his opinion, that the last opportunity for the peaceable settlement of the slavery question, in this country, had passed by unimproved; and then he uttered those prophetic words, "*Slavery shall perish, but her sun shall go down in a sea of blood!*" It is easy for us now to see how much better than most preachers or statesmen he read the signs of the times.

Dayton, O. L. L. Langstroth.

Continued.

MANUM INTRODUCING VIRGIN QUEENS.

PRACTICAL SUGGESTIONS FROM A. E. MANUM; THE VALUE OF HATCHING BROOD.

I was talking to the bees, and said:

"There, take *that*, and we will see if you will accept this queen."

"Hello, Manum! what are you trying to do with those bees all shaken out in front of the hive?" asked Mr. Charles McGee, as he made a call on his return home from his own apiary, which is located eight miles distant.

"Well, Charles, you have caught me this time, sure. I have always claimed that my method of introducing virgin queens was successful; and while it is, as a rule, yet I find an occasional colony that gives me more or less trouble; and while, formerly, not over two per cent of my virgin queens have failed to be accepted, this year I think all of five per cent have missed, and the second queen has been given, while this colony have killed the second one, and I have just given them the third one."

"What do you attribute the failure to?"

"Well, Charles, to my mind there are two causes. One is, the lack (or dearth) of honey in this locality. The bees being idle, they are more sensitive and irritable, and hence more particular, perhaps, about accepting queens; and then, again, owing to the press of work, I have given some of my colonies queens too soon after removing their old one; and in many cases I have been obliged to give them queens that had been hatched several days, and that had remained in the nursery cages that were in colonies which had laying queens; and having neglected to feed these colonies regularly, and as bountifully as I ought, the colony became enraged at having hatched queens within their hives. They tried to kill them, but could not, as these virgins were safe within the nursery-cages. In many instances, when I would go to these nursery colonies for a queen I would find the cages balled by enraged bees, and, of course, the queens within became excited, and more or less scented with the poison emitted from the enraged bees. Therefore this condition of things I believe to have been one cause of the non-acceptance of so many queens. I tell you, Charles, there are many little things which we are liable to overlook or neglect, which are the real cause of some of our failures; we should, therefore, be watchful of little things."

"Do you think this colony will now accept this third queen?"

"Yes, I do, because I have prepared them expressly for her. In the first place, as soon as I found they had killed the second one, I gave them hatching brood. I was careful not to give them a single cell containing eggs or larvæ—*not one*. At the end of four days from the time of giving them the hatching brood, they were in the same condition that they were fifteen days from the time their old queen was removed, and hence in the right condition to accept a virgin. But, in order to make a sure thing of it, I shook the bees off the combs in front of the hive, as you see, and, after re-arranging the combs in the hive, I placed a *young* virgin queen, not over three hours old, on the top-bars, and let her run down among the young bees that adhered to the combs; and as I have taken the *further* precaution to sprinkle the bees with sweetened water, that they may be well filled on entering the hive, I feel quite sure the queen will be unmolested."

"Have you other queens to introduce tonight?"

"Yes, but not in this way. There is a colony on the next row that have a laying worker, as I discovered this morning; but I could not stop then to fix them up, as I had urgent work to do in another apiary. If you will wait I will show you how I do it. First, I will go to the nursery-hive and get a queen. I want a very young queen for this purpose. There—there is one just hatching in this corner cage. I will take her. I will put the cage she is now in in my pocket, to keep her warm. Here is the hive with the laying worker. I will first remove all this drone brood and every queen-cell they may have started, and give them this comb of hatching brood. You will see that I have destroyed and removed every larva and egg; now I will place the queen on the comb right among these hatched and hatching bees; and now I place the comb in the center of the brood-chamber. Now I will put in these three empty combs to take the place of those that contained drone brood started from the eggs laid by the laying worker, and now the work is done."

"Well, Manum, you have cleared up some things which puzzled me. You know I am running one of my apiaries after your method of removing queens, and I like it very much—much better than I thought I would. But some of my virgin queens have been rejected, and I was at a loss to know how to account for it; but I think now all is clear. I had thought of giving my queenless colonies queen-cells, and I called to-night to ask you about it. If they will accept a queen-cell, that will save all trouble of fussing with queens. I saw in the *Review* a few days ago, that one man in Colorado gives his bees cells instead of hatched queens. What do you think of it?"

"Don't you do it, Charles—at least, not as a rule. I have done so occasionally, at some out-apiary, when only two or three colonies needed queens, and I had none for them; and to save an extra journey I have given such colonies queen-cells; but usually I have had trouble with these colonies, in one way or another. If the cell given them contains a *good* queen, which is not always the case, and she is accepted, which is also 'not always the case,' they are *liable* to swarm out with her—more so than if a hatched queen is given them—at least, that has been my experience. I therefore prefer giving a hatched queen, because, in addition to the reasons I have already given you, I can select my queens before introducing, and use none but the best; whereas, by the cell method one has to 'go it blind' to a certain extent."

"When introducing virgins at what you call the proper time, viz., 15 days after removing the old queen, do you find there is any choice as to how the queen is given to a colony?"

"Yes, Charles, I do. I have tried various ways, such as running them in at the entrance just at night, at midday, and in the morning; by removing one of the combs and placing her on it among the bees and then returning the combs; by placing her on the top-bars, and, again, by letting her in through a hole in the honey-board by shaking a portion of the bees from the combs in front of the hive and dropping the queen among them. But I have succeeded best by the simple way of letting her run in from the top of the sections. I simply raise one corner of the enameled cloth just enough to expose one of the openings between sections and lay the nursery cage, containing the queen, over this opening, with wire-cloth side down; then draw the slide and wait a moment for the queen to run down into the sections, and the work is done. No matter how many tiers of sections may be on—the more the better. While I have succeeded with all the various ways I have mentioned, I prefer running them in through the sections; and why? Because by this method the bees in the hive are undisturbed, the operation being performed so quickly and quietly; and the bees find themselves at once in possession of a queen, without knowing whence she came; and, having entered from the 'attic,' she is first introduced to loaded bees just from the field, or quite young bees, both of which are indisposed to quarrel; and in making her way down through the sections she takes on the scent of the colony, which gives her an unquestionable passport, and all is safe.

"When you call again, Charles, I will tell you something of my new method of management, where bees are allowed to swarm without giving an increase in colonies."

Bristol, Vt., Dec. 3. A. E. MANUM.

[We are always glad to get articles from Manum, because they "smack" so strongly of practical, every-day experience. It is indeed true, that, in order to have success, there should not be any eggs or unsealed larvæ—nothing that will give them any hope of rearing a queen themselves They are then in good condition, realizing their helplessness, to accept a virgin; and a lot of young bees in the hive goes a long way to establish peace. Hatching brood is always good capital. Mr. Manum's idea of having a queen pass down through the sections among young bees and loaded field bees is excellent.]

SUGAR-FED HONEY.

JUST A WORD OF EXPLANATION, AND NO MORE DISCUSSION IS CARED FOR AT PRESENT.

Editor Gleanings:—I thank you most sincerely for allowing me to clearly define my position on the sugar-honey question, but I have had my "say" so fully that I have nothing further to offer. Like yourself, I think nothing will be gained by continuing the discussion at present. There may be an article or two more in the December *Review*, and possibly a slight editorial reference to the matter, then the subject will be dropped for other important topics that are pressing for recognition.

If you will allow me, I should like to explain in regard to the one or two points touched upon by "A. I. R." on page 897. The first point, that, if sugar fed to bees becomes honey, then there is an absurdity in adding *real* (floral) honey to prevent crystallization, is answered by "A. I.

R." when he admits that some floral honey granulates in the combs. I doubt whether the addition of *fireweed* honey would prevent the granulation of sugar fed to bees, if there was any inclination on the part of the sugar to granulation. In fact, I think that the addition of the honey would aid the matter. A. I. R.'s experience is different from mine when he says that almost all sugar fed to bees will eventually granulate. I have fed a great deal of sugar for winter stores, without the addition of any thing to prevent granulation, and granulation has occurred so seldom that it does not seem worth mentioning. There is a difference in sugar as regards this matter of granulation, just as there is in natural honey. Most sugar when fed to bees does not crystallize; most nectar when gathered by bees does not granulate; some kinds of either will granulate, hence I see no argument in this point.

If Bro. Root will read carefully Prof. Cook's article in the October *Review*, also the extract taken from the *College Speculum*, he will see that the students did not pronounce the sugar honey "basswood." They "pronounced it undoubtedly honey, and of excellent quality." It was the chemical analysis and not the taste that classed the sugar honey with that of the finest clover and basswood.

Thanking you again for your generosity and fairness in allowing me the use of your columns to make my position clearly understood, I am as ever yours, W. Z. Hutchinson.

Flint, Mich., Dec. 5.

[We are yet to hear from Prof. Cook, at which time we expect to copy his *Review* article.]

REPRODUCTION IN THE BEE.

SOME THINGS NOT YET EXPLAINED.

The patient efforts spent by our ancestors upon our inherited knowledge are almost always overlooked, underestimated, or ridiculed. In the light of our present knowledge, crystallized from concentrated study of ages, the mistakes made by the ancient naturalists and students floundering about in complete darkness seem to be or are too often treated as inexcusable. Of no subject is this more true than of the reproduction of the honey-bee. A little thought, however, and a brief comparison with the reproductive systems of the better known and more approachable animate beings will suggest a reason for much of the seemingly wild guesswork with which the habits of this little worker were distorted. So complete a departure—reversal, almost—of the more observable laws of nature was well calculated to foster erroneous ideas.

In a general way, we now understand the functions of the three branches of the bee-family—the drones, queen, and workers. But who would expect to encounter, in a herd of several thousand wild cattle, a single cow, a few bulls, and the vast body of the herd sexless, or practically so? No wonder Shakspeare penned of them, "They have a king and officers of state;" and when we come to the remark of the ancient naturalist Aristotle, that "some say the rulers produce the young of the bee," we should rather be surprised that they had learned so much about them as they had. Nor were all the great mistakes on this subject made in the earliest times. Virgil, about the time of Christ, makes the assertion that a custom, said to have once existed in Egypt, to replenish weak swarms, was to suffocate a young bullock, cover the carcass with flowers, the worms appearing in the decomposing flesh, and hatching into bees, being utilized to strengthen the depleted colonies. Virgil, however, states this only as a historical fact, leaving it for Englishmen of a later century to gravely repeat it as a practical truth.

In 1617 an English physician, Joseph Warden, in a volume entitled "The Feminine Kingdom; or, the True Amazons," gave many hitherto unkown facts about the bee, among which was the assertion that the queen was at the same time ruler and mother of the colony. An English bee-keeper by the name of Butler is also said to have understood this at even an earlier date.

A little further back I said we all now understand the methods of reproduction in a general way. Let me now add, *and in a general way only*. With all our boasted nineteenth-century knowledge there are a good many things in this subject quite undetermined. In the hope of adding something to the knowledge of some one, this article is written. Let us now consider the uses of each member of the hive, and inquire into the reproduction and development of each, beginning with the queen.

Everybody, perhaps, knows that the queen-cell is larger than the worker-cells, and opens downward. Into this an egg is placed; just how is still disputed. Some claim to have seen the queen deposit it there herself, while others are as certain it is carried there by workers. If all things are favorable, the larva becomes a queen in 16 days. Previous to this, by about 8 days, the old queen leads a portion of the swarm away to other quarters, giving her young successor undisputed sway from the first. This, however, is in case the weather and conditions are favorable. If the young queen hatches before the colony is ready for her, the workers confine her in her cell, and care for her there until the conditions are more favorable.

On being released, her first act is to make a tour of the hive and destroy every embryo queen that, if allowed to hatch, would in time become her rival. If this destruction is interrupted by the workers, or incomplete for any reason, a second swarm is usually the result. This destruction is rendered the easier by the victim of it, who leaves one end of the cocoon open, and thus exposes herself to just such an attack. The queen-bee seldom makes any use of her sting except to destroy rival queens.

If the weather is bad, and the honey-flow ceases, the workers not infrequently destroy all queen-cells and thus stop all swarming for the season—a method the keeper himself sometimes resorts to for the same purpose.

Perhaps the most curious fact connected with the bee colony, and the one that has been the least explained, is the action of the swarm when a queen is lost. If the colony is healthy, and there is brood in the hive not over three days old, worker larvæ are removed to queen-cells, where they are fed on the "royal jelly," and in the course of time become full-fledged queens. That the extra nourishing and stimulating food should increase the size of the bee receiving it, and perhaps reduce the time required for hatching, just as plants are hurried along by the forcing process, is not so very remarkable. But that the larva, which, by the regular course of nature, would develop in 21 days to a sexless member of the family, of short life, small size, gingery disposition, and, withal, a strong veneration for a queen, could, by the magic influence of more commodious quarters and better food, become in five days less time a much larger member, with a fully developed sexual organization, a strong dislike to attack any except another queen, for which their hatred is deadly, a greatly prolonged life, and the physical and character peculiarities almost entirely opposite, is certainly surprising, and, in our present incomplete knowledge on the subject, wholly unaccountable. After all, the ancients were not entirely alone in their ignorance. The fact itself was first announced in 1771 by a Saxon clergyman; but the explanation we are yet to announce. With characteristic thrift we have, however, promptly adapted the discovery to our commercial instincts, and queen-raising is neither an unprofitable nor a superfluous industry.

Unlike the worker, going and coming constantly, the queen, all things being right within, seldom if ever leaves the hive except on her "bridal tour," or when preparing to lead a swarm to pastures new. The first-mentioned outing she takes, if the weather is favorable, the third day after hatching. If unsuccessful she repeats the trip until fertilized. This must be within 21 days or she will be barren. The danger to the entire colony, attendant upon the flight and exposure of the queen, is lessened by the considerable number of drones, or males; a number, in fact, that many are inclined to wonder at, considering that there is but one female, and she requires to be fertilized but once in a lifetime. This always takes place out of doors and while on the wing.

Sterility does not prevent the laying of eggs. Indeed, when the queen has been lost, a worker has been known to produce eggs. But these, as well as those of the unfertilized queen, invariably produce drones. Thus the one great known law governing reproduction in all its branches is established. Fertilized eggs will produce workers or queens as they are reared in a worker or queen cell, while unfertilized eggs invariably produce drones.

WILDER GRAHAME.

ANOTHER BEE-ESCAPE.

SOLAR WAX-EXTRACTOR IN CALIFORNIA; ITS USES AND ABUSES.

Friend Root:—I send you with this letter a model of my bee-escape. It was invented two seasons ago. After a number of successful trials I was on the point of telling about it through GLEANINGS, when I found a case in which it did not work, even after the escape had been on several days, so gave it up; but as I see Dr. Miller reports (page 795) a like experience; and I presume, with some of the improved bee-escapes, I am emboldened to send on mine. I have tried it along with some made on the plan of the Reese cone escape, and I have seen the Dibbern star escape used. This does better work than either of those. In fact, in most cases, after a few hours, the super is practically free from bees. Whenever I have used it I have placed a super, filled with empty combs, beneath the one which I wished to remove, having the escape, of course, between the two supers. It may not do so well if this extra super is not used.

If you will examine the model you will see that the large holes through the tin, by which the bees are to make their exit, have been punched from the upper side. This makes a rough rim around the hole on the under side, and over which the bees will have to climb in order to pass from the brood-chamber to the super. This they do not like to do, but will try to pass through the small holes, whose under surface is smooth, and which are intentionally made a little too small for that purpose. The cleats around the escape on the upper side are to make the bee space beneath the super frames, and on which the super is to rest.

Several strips of tin, instead of one, as in the model, may be used. This permits of a great many passageways and the rapid emptying of the super. You will also see that the bees in the super have a passage to the outside, which, I believe, is a favorite way with our British cousins. I find a great many leave the super by this route. Noticing the unusual light, they go to investigate, fly outside, and invariably return to the hive by the entrance in the brood-chamber.

GETTING THE WAX FROM THE SLUMGUM.

I have been kept indoors to-day by our first rain this season—a glorious one—five inches having fallen in twenty-four hours, or about half as much as has fallen in the preceding nineteen months. Besides the building of the bee-escape which I send you, I have built a great many castles in the air, relative to the big honey crop I am going to make next year, enthused thereto by this glorious downpour. I have also put in some time between whiles, melting wax. The wax rendered was mostly new comb and scraps of foundation, with perhaps a dozen old combs. In rendering it I tried

MRS. AXTELL'S PLAN.

This was spoken of in a recent article by her in GLEANINGS. It consists in boiling and straining twice the cocoons and other refuse left after melting old comb. The result rather surprised me, as, from the second boiling and straining of perhaps a gallon measure full of slumgum, I pressed out a full pound of wax.

When I can get at old combs on a frosty morning, and crush them to powder, then soak 24 hours before rendering, I always feel satisfied that I have got all the wax from those combs. I believe this method frees the wax from the cocoons as entirely as does rendering them with acid. In fact, I was rather disappointed on rendering some combs with sulphuric acid. From what I had read I inferred that the cocoons were entirely disintegrated—eaten up—by the acid; but after rendering some old combs by that method I could not see but that the cocoons looked the same, and were as capable of absorbing wax as when rendered without acid.

Sun extractors can be profitably used, only with new comb. When old brood-combs are rendered that way, the cocoons absorb a large part of the wax. Some of our bee-men have a practice of going through their hives every few years, and cutting out all black combs, replacing them with foundation; and although the sun extractor is considered among the necessary appurtenances at an apiary here, so unprofitable has the melting of these old combs in them been found that I have known persons to use such combs as an auxiliary to the woodpile. Our neighbor, after culling out old combs from an apiary of 300 colonies, had a pile of them which loomed up like a small mountain. He cogitated for two years what to do with these combs. He was positive that it did not pay to melt them in the sun extractor. One day he touched fire to the pile, and a good many dollars' worth of wax went up in flames. Of course, it would have been better to melt them in his sun extractor than to do this, although burning them was on a par with the idea which instigated the cutting of the combs from the hives in the first place.

If the apiarists who play such tricks would read the bee-papers and text-books they would know that old combs have as much wax in them as new ones, it only being more difficult to get out, and on this subject they would get many pointers, as instanced by myself from the perusal of Mrs. Axtell's article. I will add, that the style of solar wax-extractors in general use here are capable of being much improved. Of all extractors of this kind which I have seen, I like best one with a curving bottom, like the Doolittle, illustrated in your catalogue, as in it it is convenient to get at the slumgum with a paddle, and press the wax therefrom.

Newhall, Cal., Nov. 27. W. G. Hewes.

[When Mr. Hewes' model first came to hand we made fun of it, not knowing from whom it came; but after discovering its source, and having confidence in our correspondent, we thought differently of it. It would be difficult to show the real principle of it by an engraving, and we would therefore explain that a strip of tin is mounted in an ordinary honey-board. Through the tin are punched holes just large enough to let the bees through one way. As they are punched with a large awl a ragged burr edge is left tapering to an opening large enough to admit a bee from the side in which the awl pierced, but not from the reverse side. The only difficulty that occurs to us is, it would be impracticable to get the same excluding burr edge every time.]

RAMBLE NO. 74.

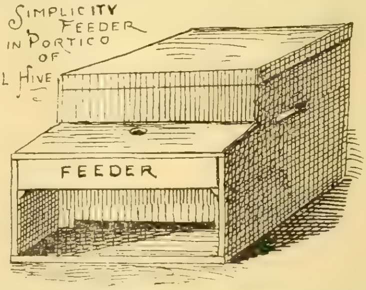
RAMBLER AT WHEELER & HUNT'S.

"Founded in 1887. Headquarters of the Bear Valley Irrigation Co., having water for the irrigation of half a million acres. The largest irrigation enterprise in America. Products—Oranges, lemons, peaches, apricots, raisins, and honey."

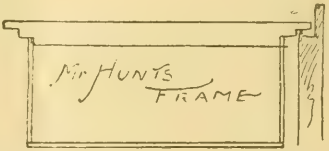
Thus runs the legend in relation to the young and thriving town of Redlands, located in the upper end of the San Bernardino Valley, with the lofty San Bernardino Mountains for a background. It is no wonder that people look upon the location as another Switzerland. From some of the heights in the suburbs of the town, grand views of the valley and its orchards can be obtained. Redlands, as I have before stated, is the headquarters of the honey-producing firm of Wheeler & Hunt. Back a little from the city, and in the foothills, are located the Mound City, Brookside, San Mateo, and the Yucaipe apiaries; fourteen miles to the west, near Riverside, is the Jurupa apiary; and sixty miles away, in San Diego Co., is the Fall Brook apiary, which was purchased, I believe, from Mr. Harbison. The rest are in Langstroth and a modified form of the Langstroth and Simplicity hive. Mr. Wheeler, the senior member of the firm, has attended somewhat to the supply business, and has never been an active worker in the apiary. His son Frank, however, has every year taken charge of an apiary, and is an expert manager of bees. During the past year Mr. Wheeler has been interested in the development of the Rose gold-mine, in the San Bernardino Mountains, and in which he is one of the largest stock-holders. The mine has recently struck a great amount of ore well loaded with gold, and Mr. W. finds that this source for raising the golden shekels is more rapid than getting them through a bee-hive.

In relation to bees and honey, Mr. Hunt has been the active field-manager of the firm. Mr. Hunt formerly lived in Iowa, and, besides owning bees, he was an extensive dealer in honey, selling it in all large towns in Iowa, Illinois, Kansas, and Missouri. The older readers of the *American Bee Journal* may remember a little controversy between Mr. Hunt and Mr. Van Dorn, of Missouri. The latter accused Mr. Hunt of selling glucosed honey. Mr. H. called for an analysis of his honey, and the result was a complete exoneration from the charge. Mr. H., however, says that dealers did adulterate honey, and invariably used the darker grades for that purpose.

About six years ago Mr. Hunt threw up his honey-trade, and came to California to engage exclusively in its production. His first venture with bees was very successful; 135 colonies were rented; increased to 200, and yielded 307 lbs. to the colony. The next year he purchased bees; and from about 400 stocks, which he valued at $800, he realized $3500 from the sale of honey. With this grand result there came a desire to own all the bees in California. No, perhaps not quite so much as that. We will say a large number. Enlisting the interest of Mr. Wheeler, a large number of colonies were purchased, and the business entered into on a larger scale. Heretofore Mr. H. had worked his apiaries for extracted honey; but now a change was made, and a portion of the apiaries were worked for comb honey. The past three seasons have not, however, been remarkable for heavy yields, and especially for comb honey, and Mr. H. expresses many sighs of regret that he ever changed at all from the extracted plan. The out-apiaries have been worked during the honey-season with hired help, and the helpers, many times, have been more of a damage than a blessing. An inexperienced man is liable to extract too close, and then feeding must be resorted to in the winter, which, even in this climate, is not a pleasant job. The prices paid, and the kind of help wanted, have been explained in the previous Ramble. In two of the apiaries, Brookside and San Mateo, there is something of a mixture of Cyprian blood, and it is of that kind that Mr. Mendelson told us of that will sting a stovepipe until it is expected to squeal. A helper in one of these apiaries employed his spare hours in picking bee-stings from his clothing and various portions of his body, and thus obtained a box full. These apiaries will be worked another year by Messrs. Powell and Zanft, and we wish them a comfortable time. Mr. Hunt is a rapid worker with bees, and his methods were admirably touched up in the *American Bee Journal* about a year ago by Mr. H. Hill, of Pennsylvania, a former employe.



Simplicity Feeder in Portico of L Hive
FEEDER



Mr. Hunt, like all progressive bee-keepers, is continually studying up short cuts and improvements in management. In order to stimulate in the spring by feeding, each L. hive is permanently fitted with a Simplicity feeder, as shown in the sketch. A hole in the end of the hive allows the bees to gain access to the

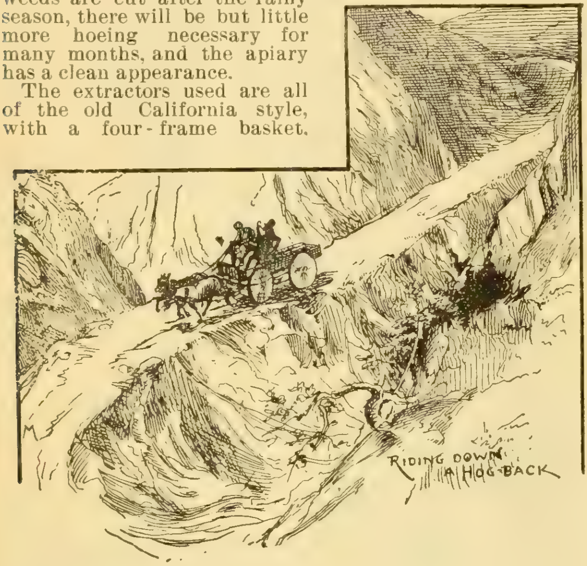
APIARIES OF WHEELER & HUNT, CALIFORNIA.

feeder, and a hole in the cover to the portico allows the feeder to be filled, and outside bees can not molest.

The apiaries of this firm make a fine appearance, as will be noticed by the photo. There is one convenience in a dry climate: If the few weeds are cut after the rainy season, there will be but little more hoeing necessary for many months, and the apiary has a clean appearance.

The extractors used are all of the old California style, with a four-frame basket, some of which are hung in a large wooden tub. The highest number of colonies owned by these gentlemen has been about 1500. The past three bad seasons have reduced the number to about 1200. If increase is desired, however, a good season would boom the colonies to an astonishing extent. As an experiment, Mr. H. increased 18 colonies to 100. and secured $200 worth of honey; but that was a boom season.

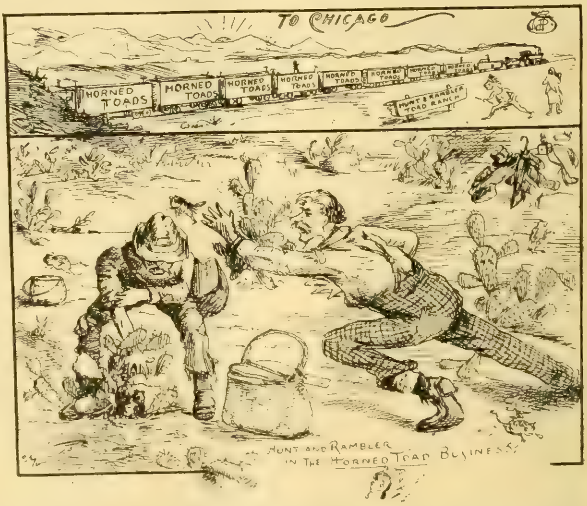


"Headquarters" is a fine brick building, and the entire first floor is filled with hives, supers, and all the paraphernalia of a bee-business. Hives and foundation are made here. In dipping wax sheets, Mr. Hunt uses a gang of four dipping-boards, making 8 sheets at every dip. In the line of putting together sections and putting in foundation, Mrs. Hunt and Arthur, the 12-year-old boy, are very expert.

Bees propolize so much around the ends of the top-bars of brood-frames in this climate that Mr. Hunt makes his hives large enough to give a bee-space around the end of the top-bar; and to insure against the frames moving endwise, another shoulder is cut on the end of the frame, to fit the metal rabbet, and the frame is held secure. Mr. H. would like to try the Hoffman frame here, but would want the top-bars made on the above plan.

As before stated, the apiaries are located back in the foothills. These hills are cut up by many ravines, or gulches—or, as the Spaniards say, *arroyas*. The ridges between are veritable hogbacks, and some of them, upon which a trail leads, are not adapted to safe riding, especially if the horses are subject to shying. Mr. Hunt rattled the Rambler over one of these hogbacks at the imminent peril of his plug hat and umbrella. Mr. Hunt is something of a genius; and, though his mind has never become inflamed with the gold-mine fever, he expects to strike it rich upon something in the mechanical or speculative line. During the honey season the energies have been running at high pressure; and when the slack time comes they must find something to feed upon. At present Mr. H. is working up a grand scheme to supply the world with "Herba Santa" cigarettes. Herba santa, or "blessed herb," grows luxuriantly in this climate; and, besides being a honey shrub, it has ever been known as a medicinal herb of great importance, as the name signifies. The leaf is of the lanceolate order, and is covered with a glutinous substance that gives the leaf a high polish. When eaten they have a highly aromatic taste; the leaves work readily into cigarettes; and, besides their medicinal qualities, Mr. Hunt has made the above discovery; and while the Rambler has about as much faith in the medicinal qualities of the smoke as he had in the divining instrument, still "Herba Santa" cigarettes wrapped in harmless paper would certainly be an improvement over the death-dealing tobacco cigarette; and with this end in view, Mr. Hunt regards the scheme as highly philanthropic. The Herba Santa factory is not started, however, and the scheme is not brewing so strong as it did a few months ago.

I suppose the senior editor, when in California, noticed, in the windows of curiosity stores, great numbers of horned toads, taxidermized and mounted upon cardboard, and looking as natural as life. Mr. Hunt and the Rambler have hunted horned toads; and, as they are easily hunted, captured, and prepared, we have a scheme for putting several carloads on sale at the World's Fair, at 50 cts. each. There is a bonanza greater than a gold-mine in it. Hunting them among the cactus bushes might fray out our pants a little; but consider the bags of



shekels that would come in. Our plans are well defined; and from the sketch you observe that our scheme looks well on paper.

It may be considered by some that bee-keepers should not indulge in the elaboration of such schemes; but that, perhaps, is one disadvantage bee-keeping rests under in this climate. The actiye season is for only a few months, and then there is ample time to indulge in schemes or business, and too often the other things absorb time that should be devoted to the bees.

The great need of bee-keeping in California is, to make it an all-the-year-round business; and to that end we ought to rejoice at the scheme of Messrs. Hutchinson and Cook in relation to sugar feeding to make honey. With our Chino and a dozen other beet-sugar factories, and endless summer, we could flood Michigan knee-deep with that kind of honey. The Rambler will immediately visit the Chino sugar-factory and give you the results of our researches.

Although Messrs. Wheeler & Hunt have so many apiaries around Redlands, there are many others; and we may at some future time describe some of them to you; but for the present, *adios* says the RAMBLER.

[That there are advantages in having top-bars as illustrated, can not be denied. We have thought some of making frames that way, but could not see our way clear to do it, because it would make an expensive change. In moving bees over rough roads there would be danger that the frames would hop out of place, and, of course, one end would drop down and spoil the whole. Taking it all in all, we question very much whether it would be wise to make the change, even if it would not break up the uniform length of all Langstroth top-bars.]

STARVING INDIA.

FURTHER PARTICULARS FROM MR. FRANK VAN ALLEN.

Mr. A. I. Root:—I have received by this day's overland mail from Europe, which reaches us once a week, the $34.80 which yourself and your customers have so kindly sent me. We have indeed had a hard time with threatened and actual famine in South India. In many districts -actual famine has prevailed, relief works by Government being the only means which has prevented the utmost distress. For several months we were stared in the face by the prospects of the fearful famine scenes of 1876 and 1877 being repeated, when upward of 5,000,000 people are estimated to have died from actual starvation, diarrhœa, and famine-fever. The prompt action of the English Government has tided over for us now a critical time, and prospects are much brighter; and, though this is so, times are very hard, and the prices of grains in some cases almost touching famine rates. There are some of our Christians among the natives, who barely get one meal a day. The effects of a serious scarcity last for some time; by this we are cheered, that it is only the remnants of the recent serious scarcity, and that, as we have now had good rains, the crops will soon begin to come into market, and the high prices will be reduced. The state of affairs now in South India is well represented by this: Rice (the staple food) is 5¼ measures for a rupee. The usual price is 8 measures for the rupee. A rupee is about 35 cents, and the wage of the mass of the people is about 6 or 8 rupees a month. A "measure" is a little more than a quart.

My work in India is that of a medical missionary. I have a hospital and dispensary in Madura (pronounced Mád-ju-ra). European medicine is appreciated here in India, due to its intrinsic value and the effect of the influence of the English Government. My dispensary is thronged every morning with those seeking either simply medicine or else surgical relief. Last year I treated (with the help of my two "dresours," or native medically qualified men) a little over 38,000 cases (including new and old ones).

Our dispensary and hospital has an excellent name for miles about, and it is not in the least unusual for patients to come 40 miles in a bullock cart, for treatment; and sometimes they have come more than 100 miles. Of course, the majority of my patients come from Madura and the immediate surrounding villages. Last year, patients came from 246 different villages, near and remote. Such a work, as a well-known medical work, is a Christian light that shines brightly in such a heathen country as India. It is the means of making many friends for Christianity. It has always been the policy of our mission to have medical work that the people may see, as they perhaps might not otherwise, our disinterested motives, and know that we seek only their best good. They get an insight into our motives through our medical work which they otherwise would not in most cases. They know that the door of our dispensary is always open, day and night; that medicines are to be had without money (unless they choose to pay for them; but the great majority do not do so), and that the hand of the missionary doctor is ever ready to help. A good deal of the money for my work comes from America. I get also good local grants, and my wealthy patients often give me most liberally for my hospital. From this source alone I have received this year about one-third of my whole expense for the year. I try to make this country bear as much of the expense as possible, but the great majority of the people are very poor indeed.

Perhaps you would like to look at a few of the cases in my ward. In one bed lies a man who came suffering with what is called "Madura foot." The foot becomes diseased with a peculiar fungus which, by the way, is found only in the Madura district in South India, and here it is, unfortunately, very common; begins to swell, becomes painful; later, disorganizes; and there is but one remedy, and that is, *removal.* This man's leg was amputated just below the knee. He is entirely well now, and goes home to-day (of course on crutches). He asked me for a new "cloth." A "cloth" is the name of a straight strip of cloth, rather less than a yard wide, and a yard or two long, wound about the hips, and falling to the knees. This is the one garment worn here by the poorer classes. As a rule I give only food; and when he asked for the cloth I told him I couldn't do it; but I shall now spend a very little of this money, which you have sent me, for him, and try to impress on him that it is the gift of friends thousands of miles away who have never seen him and never will, but who wish him only good.

Another case in a bed not far from his is that of an old woman who fell on a jagged piece of wood, tearing away her entire breast. It was a most ugly wound, but she is now rapidly recovering, and will go home in a few days. Another woman is suffering from a large and serious abcess. Near by, in another bed, lies a little boy, about eight years of age, who was brought here by his father about two weeks ago. He had fallen from a tree and broken his arm just above the elbow. The mother had taken him then to a native medicine man who put on a number of thin bamboo strips (very good splints), but had bound them down very tightly with wyths of cocoanut fiber. The little fellow was moaning and crying when they brought him here. The whole arm was dead, from the tight pressure applied. In fact, it had been so for three or four days, and was quite offensive. He had high fever, and no doubt would have soon succumbed. I amputated at the shoulder, and he is now nearly ready to leave the hospital.

I could write pages, and scarcely know where to stop, but will do so now. Thanking you again, and those who have kindly made up this sum to send out here for use among these people, I beg to remain yours very sincerely,

Madura, Nov. 9. Frank Van Allen, M. D.

BASSWOOD AND CLOVER HONEY.

HOW AN UNEDUCATED TASTE FAILS TO DISTINGUISH THE DIFFERENCE.

Friend Root:—Gleanings came to hand today, and I noticed your editorial on "feeding bees sugar to make honey." In reading your question, if it were really true that those students could not tell basswood honey from sugar syrup after it had been fed to the bees, it struck me that I could offer a probable explanation of that fact. As you may be aware, our apiary is situated almost in the business part of the town of Niagara Falls. We have one window of a building facing the street, fitted up with a fine display of honey, which attracts many customers, so that we dispose of nearly all our honey directly to the consumer. Often, when a customer asks for honey, I will say, "Which do you prefer, the clover or basswood?"

"Well, I don't know. What is the difference?"

"The difference is in the flavor. Taste them and see which you like best."

"That tastes pretty good. What is it?"

"That is basswood; now try this."

"Why," he remarks in surprise, "I don't see any difference; both taste alike to me."

"Does it? Well, try the basswood again."

"Oh, yes! I see now there is a great difference in the flavor."

I have tried it many times, and it is almost invariably the case, that, if the basswood is tasted first, the average customer does not detect any difference between the two kinds of honey; but if the order is reversed, and the clover tasted first, its milder flavor is noticed at once, and generally preferred.

Niagara Falls, Ont. W. H. Brown.

[You are probably correct. After eating basswood honey we have oftentimes been unable to get the full flavor of certain kinds of sauce. In a similar way, novices might fail to detect the difference between basswood and clover honey.]

WHICH WAY SHOULD HIVES FACE?

G. M. DOOLITTLE PREFERS THE SOUTHEAST.

Question.—"All things considered, which way should hives front, in order to obtain the most profit from the bees—east or west, north or south, where they are wintered on the summer stand? and which way when they are wintered in the cellar?"

If I am to understand by the last part of the question that the inquirer thinks that it makes a difference which way the hives face while in the cellar, I will simply say that he is making a mistake, for I can not see how it could make any possible difference in a cellar of even temperature and total darkness. If there is a window to the cellar which admits light, it is better to darken the window; yet at my out-apiary cellar the people don't want the cellar dark, so I face the hives away from the light, and, so far as I can see, they winter just as well as in a perfectly dark cellar. But to the other question, which way should they face while on their summer stands? Some seem to think that it makes no difference which way the hives face, but I think otherwise, especially in winter. I have had hives facing almost all points of the compass, and those doing the poorest faced the north, while those facing the southeast invariably did the best. I have lost colonies in winter facing the north, when those facing the south and east would have good cleansing flights, and be in good shape for another long cold spell, the others not flying at all on account of the sun not shining on the entrance, hence died with diarrhea, as it is called, by not having a chance to void their excrement.

Again, in summer, bees in hives facing the sun will generally work longer each day than will those whose entrances the sun never shines upon. Once more, the prevailing winds are from southwest to north, in this locality; and where hives face the west or north, more stores are consumed in keeping up the heat of the cluster where the prevailing winds blow directly in at the entrance, carrying off the heat generated by the bees.

INCREASING COLONIES.

Question.—"Having 17 colonies of bees, and wishing to increase them to 50 next season, I should like to know the best way of doing it and still get some surplus honey."

A large increase of bees and surplus honey at the same time is something which is not very likely to occur; still, there are ways in which it is sometimes accomplished. One of these ways would be to let the bees swarm naturally, hiving the first and second swarms, returning those which came out after the second. Put sections on the first swarms, having them in contracted brood-chambers; and if the swarms come early enough in the season, box all the old colonies as soon as the young queens commence to lay. A still better way would be to keep the colonies from swarming as much as possible, hiving the few swarms which did come in contracted brood-chambers as above, and, six days after any swarm issued, divide the old colony into nuclei with a queen-cell for each. Occasionally, as needed, to keep those not having swarmed from taking the swarming fever, take frames of brood from them and give to the nuclei, thus building them up. Replace the frames of brood taken, with frames filled with comb foundation, thus preventing the building of drone comb. If successful, as you should be, seven of the colonies swarming would give all the increase needed to make the fifty, thus leaving ten to roll up all the surplus they possibly could were the same ten worked for no increase.

RIPENING HONEY.

Question.—"What is the best plan of ripening honey where we can not afford to wait until it ripens in the hive?"

I am not sure that there could be a locality or circumstances where "we can not afford to wait" for the bees to ripen the honey in the hive. We used to think we could not afford the combs to use in tiered-up hives necessary to wait till the end of the honey season, but I now think this a mistake. Not affording the combs, the bees had to remain idle while the honey was being sealed, which was a loss of time, so the honey was extracted every three or four days, when it was thin and unfit for use; but in these days of comb foundation, much the better way is to tier up the hives, adding foundation as needed, letting the bees seal the honey as far as possible, when it is to be brought into a warm room, and, when thoroughly warmed, it will be little more work to extract it than it would be were it taken from the hive when two-thirds sealed, as was considered the proper time years ago. Honey obtained by this tiering-up plan is superior to that secured in any other way, increasing the demand for extracted honey in the markets, instead of decreasing the demand as the honey of ten to fifteen years ago did.

If you *must* ripen honey out of the hive, I know of no better way of doing it than to place it in tin cans holding from two to three hundred pounds each, putting these cans in a temperature which can be maintained at from 90° to 100° for a month or so, leaving the top of the can open, and tying cotton cloth over it to keep out the dust and insects. If you have the means, and are in a hurry to have the honey ripened, it can be done by slowly running the honey over a zigzag evaporator, which is kept at the proper temperature by heated water or lamps, so that it will ripen it fast, and yet not scorch or change the flavor of the honey. But let me advise you to let the bees take care of the ripening part. G. M. DOOLITTLE.

Borodino, N. Y., Dec. 1.

A SUGGESTION FOR CHRISTMAS.

DR. MILLER TELLS WHAT TO GET FOR THE GOOD WIFE.

This is *not* about bees. But I want every man who has a wife he cares for to read it; also the young man with a sweetheart—a sweetheart that will soon be his wife. I want to say something to you about getting a Christmas present for your wife. You're troubled to know what to get. Perhaps you can think of nothing appropriate, or, if you do think of something, it costs too much. Now look here, John; it isn't altogether what a thing *costs* that makes it valued. It's more the amount of love and thoughtfulness that seems to be in the gift—at least, with a sensible woman; and you know, John, your wife's a sensible woman.

I don't think a box of candy, no matter how costly, beautiful, or delicious, is the best thing. It isn't the finest compliment to her good taste, suggesting that she has no taste except that connected with the gustatory nerve. Besides, she'll divide it with you, and it looks too much like getting something for yourself. And it's eaten up right away, and that's the end of it. Something for herself alone, something that lasts, is better.

I knew a man who had money enough so he didn't need to count the cost; and every Christmas, whatever else he might get her, he gave his wife a pound bottle of "White Rose" perfumery, her favorite kind. It had the merit of frequent use, constantly reminding her, whenever she used it, that it was her husband's desire to give her pleasure. Being repeated each Christmas, it lacked the merit of novelty and surprise.

A periodical is appropriate. If your wife has not some such paper as the *Ladie's Home Journal*, it will please her more than a gold ring costing three times as much. Twelve times in the year it comes as a fresh gift.

But I know of something that will just exactly suit her, and it's something that you can afford. You know, John—or if you don't I do—that you're not as good to your wife as when you first married her. Oh! now don't go to getting into a passion because an old friend tells you the plain truth. Of course, you don't come home drunk and abuse her, as does Brad Simpson, the old wretch, and your wife thinks you're one of the best of men; but then, you don't show that same tender care for her that you did when you were courting her. Now, if you can give her the same lover she had then, one who is all the time trying to make things easier for her, and trying to help her, it will be the most appropriate present you can give her, and a rare surprise as well.

To particularize, suppose every morning, when she puts on oatmeal to cook (you know she thinks it better to cook it on the stove without a farina-boiler), while she is trying to do two or three other things and at the same time keep the oatmeal constantly stirred to prevent its burning, suppose you take her place at the oatmeal stirring. Your face may as well be roasted as hers, and it will make her feel young again to think that she has the old John of long ago back again.

Or, if she's boiling some milk, and is so busy with other things that there is danger of its boiling over, it will not hurt you a bit to watch it for her.

Yes, I expected just that reply from you, that it would be very nice to help your wife, and you're sure she would appreciate it, but that you have something else to do and can't spend all your time over the cook-stove.

Well, now, I'll tell you just how you can manage it, John, to do the little acts I have specified, and a hundred others; to do them not only one morning, but every morning, noon, and night of every day in the year, and it sha'n't cost you a minute of time, and only 26 cents of money. Send 26 cents to A. I. Root and tell him to mail you one augite stove-mat. If you want to be extra kind to her, send for two, for my wife thinks she needs two. I almost wish you didn't need to send to friend Root, but somewhere else, then you wouldn't think I'm writing this merely as an advertisement; but then, I'm not going to stop doing what I know is a real favor to you, just because it comes in the form of an advertisement; and when, for such a small outlay, you can get so much help, and help of the most efficient kind, too, I feel very sure I'm doing a great favor by telling you about it.

I had an augite stove-mat sent by mail. When it came I didn't feel as hopeful about it as before I saw it. It looked like a piece of pasteboard bound with tin, likely to burn up the first time it got over a hot fire. But my wife said she'd give it a fair trial. First she laid it on the hot stove for ten minutes before putting any thing on it. I don't know the object of that, but it was according to directions. It didn't take fire and burn up. Then she set a pan of milk on it. By and by it began to puff up as milk does when it boils. She thought she'd better take it off, so it would not boil over on the stove. I told her it would be nothing so terrible to have it all over the stove, and she let it boil for a long time. It puffed up in a very threatening manner, but never dared to boil over. She was quite jubilant on finding that the bottom of the pan was not at all burnt—only a thick coating, easily scraped off.

Then she put on it a dish of oatmeal to cook. After letting it cook a long time she came with a glowing face to tell me, "It's a perfect success! Oh, it will be *such* a help!"

Then she tried a corn-starch pudding. "It's a supreme success," came the report; and then with unusual enthusiasm she recounted some of the things in which the new mat would be such a help.

Now, I feel sure that, when you get one, you will thank me for calling your attention to it, and your wife will be very thankful. I shall send for a number to give as Christmas presents to friends, and I hope friend Root has a large stock, and that Christmas may take them all.

Marengo, Ill. C. C. Miller.

TIN COMB.

RESULTS OF EXPERIMENTS IN THIS LINE IN GERMANY.

We give below a free translation of what C. J. H. Gravenhorst says on the above subject, in his journal, *Illustrierte Bienenzeitung:*

Concerning the tin comb of Mr. J. Steigel, of Pernersdorf, near Jetzelsdorf, Lower Austria, we made a brief reference in Vol. 11, and are to-day in condition to inform our readers further. The next thing to do to make this comb profitable to the bee-keeper is, so the inventor informs us in a letter, to render it as acceptable to the bees as the natural comb. At best we should beware of cells only 15 mm. deep (⅝ of an inch), when the bees require those that are from 25 to 27. In the latter respect they should be comparable with the natural product. These combs remain absolutely broodless, are fully as light as natural comb, and actually surpass the latter in durability. Further, the inventor says, they are the best swarm-regulator. Steigel wants a strong colony with only as much natural comb in the brood-nest as the bees need for rearing colonies up to the requisite strength; otherwise he gives them tin comb alone.

That such combs will be as strong as common combs in extracting, nobody will doubt. Mr. Steigel is also of the opinion that, with tin combs, the hitherto non-extractible heath honey can be taken out. Such honey always tears wax comb in extracting. If that proves to be the case, tin comb for bee-keepers who harvest heath honey will be of great value. Suppose, however, that, in spite of this, the heath honey should remain fast in the comb, then the hopes of the inventor will not be realized.

He thinks he can, without difficulty, construct a comb whose middle wall can simply be withdrawn, so that the cells will then form a hexagonal network. Perhaps one might replace the cells with double bottoms, the first of which is perforated, the second covering the first, but which can be removed at extracting time. We must confess, however, that we have no faith in this idea. Attempts to extract heath honey from the Steigel combs have hitherto been found impracticable—at least, no reports have as yet reached us. Very likely the present year has been unfavorable thereto.

For more than ten or fifteen years the Americans have tried, with various materials, including tin, to make foundation. But all such attempts have been failures. But perhaps the American tin used was not prepared in the same manner that the Steigel was, and so was less available. In regard to the preparation of his tin comb, Mr. Steigel reports to us the following:

Tin strips, of the finest zinc-tin, No. 1, as wide as the cells are to be deep, are shoved through a small cogged-roller work. They receive thereby the shape shown in the cut. These cell-strips, so prepared, are now cut with common shears, four or six at a time, in pieces as long as the comb is to be broad, and laid together, thus forming cells, two of which are shown. Now begins the putting together of the comb on a board as large as the required size of the comb. On this board the strips are now put up edgewise, after the edges of contact are fastened together. After a short time the finished comb is raised from the board, and then follows the wax bath. The bottomless comb is dipped twice in melted wax—the first time entirely, and the second time only a millimeter, so that, on the surface of the wax, a thicker layer will form, which, when necessary, the bees can use to draw the cell out to its full length. The comb now receives a bottom, serving as a middle wall. Now take a sheet of tin, some five or six millimeters larger than the comb is, and bend, by means of two strips of wood, the edge of the tin over so as to form a shallow dish. This is to be placed on a warm stove, spread over with wax, and the comb laid on it. In this way the one-sided comb is made ready. Two one-sided combs will form a two-sided one. The combs are fastened in the frames with little pegs. The placing of the tin combs goes on so rapidly that one person can make 40 or 50 a day.

Edge of tin strip as it leaves the cogwork.

Mr. Steigel has prepared, at different times, in his primitive way, cells of full depth, made of pure wax. As with the strips of tin, he places his strips of wax together. But these are not manipulated with the rollwork, as shown above, but with an apparatus similar to the Ritsche wax-press. The strips of prepared wax are immediately placed in a frame, and separated by means of a partition of tin, glass, or wax. Although this manufacture of comb with cells full depth might be carried on easily and satisfactorily, yet Mr. Steigel will make no more, of wax, for sale, as it does not pay. Frequently such comb, before using, is, from some unforeseen reason, found to be useless; and especially is this found to be the case in trying to ship it. The finished comb can be most advantageously made at home by the bee-keeper himself; and where he wishes to do so, he can get the necessary press of Mr. S.

SOMETHING MORE ABOUT THE MATILIJA CANYON.

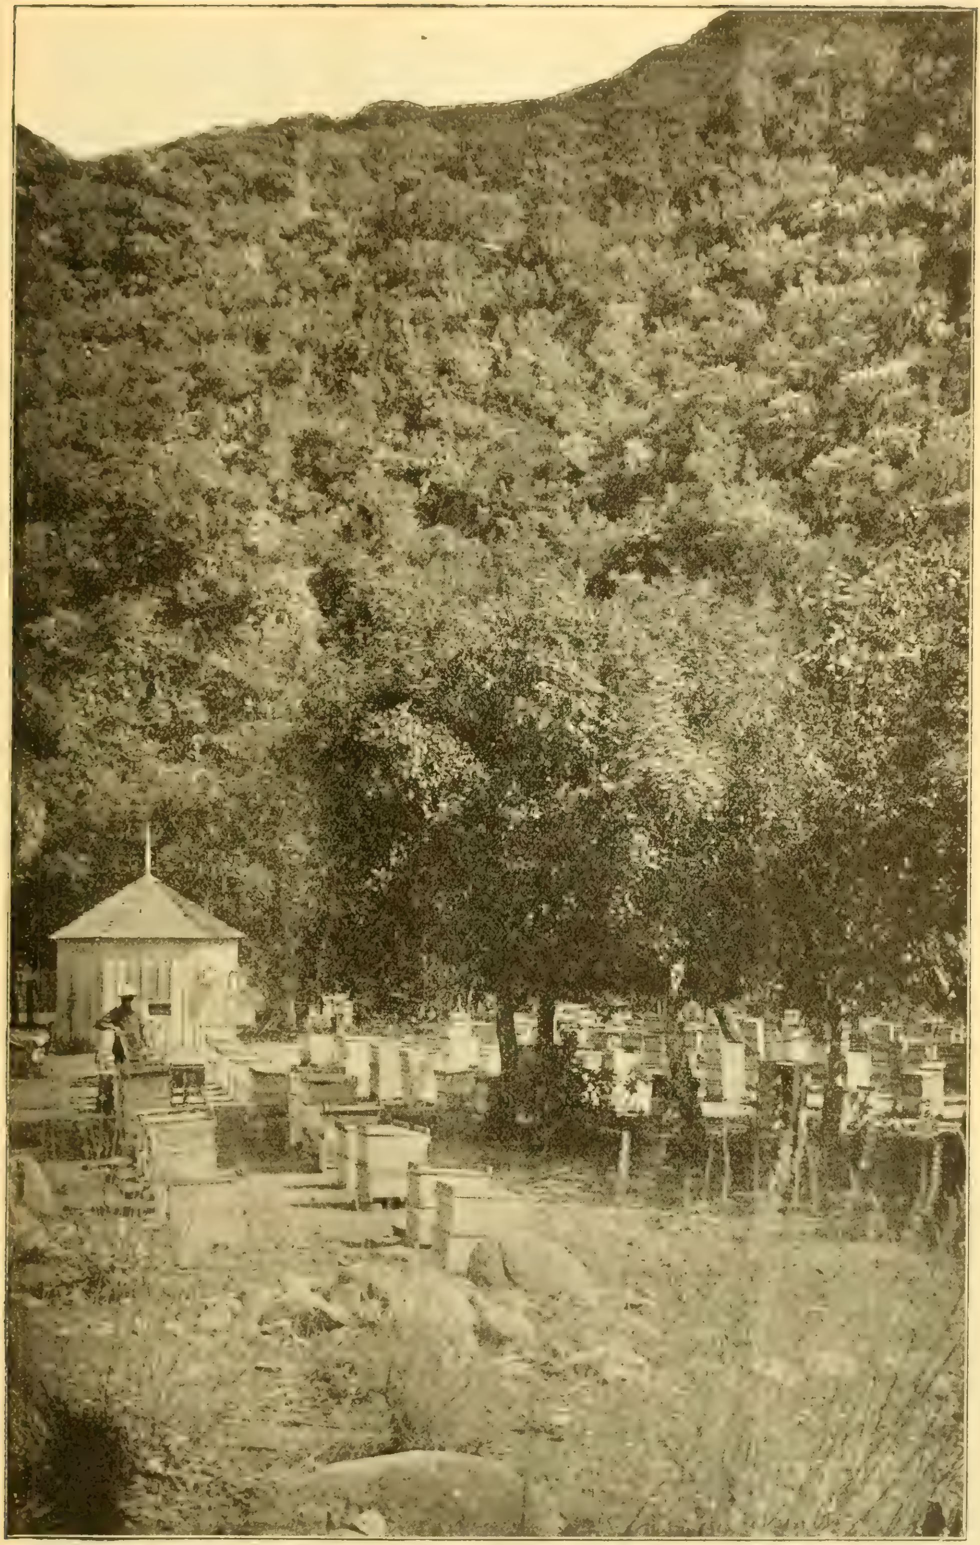
ANOTHER GLIMPSE OF THE WONDERFUL REGION WHERE THE HOT SPRINGS HOLD FORTH.

The accompanying engravings were sent us shortly after my return from California last spring; but we were having so many California views just then we decided not to use them until a little later. With the two pictures comes the following description:

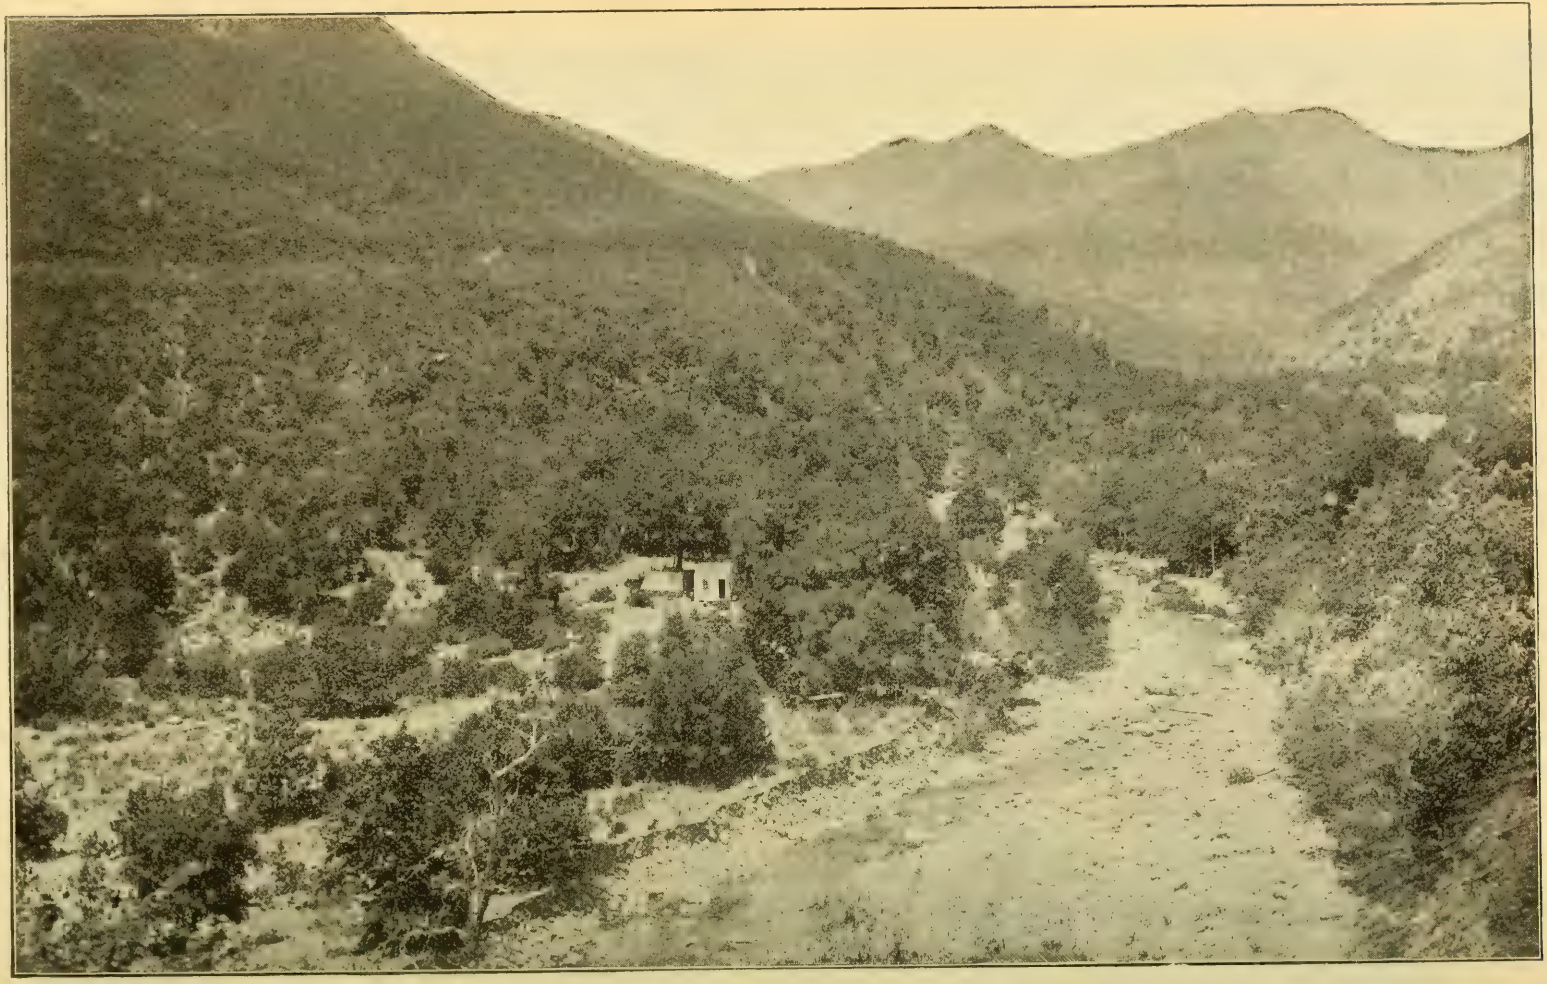
A. I. Root:—I mail you with this a view of my apiary, also a view of the canyon looking up and westward from it. It is located in the Matilija Canyon, four miles above the hot springs you visited. If you had continued your trip that far you would have been well repaid. There are several hot springs one mile below. They are much hotter, and afford more water, than the lower ones. They are not so accessible, therefore not as well known, but are even superior to them for the cure of rheumatism and similar ailments.

The mountain back of the apiary is a most beautiful one. It is as high as or higher than the ones near the lower springs, and is covered from base to summit with an even growth of evergreen chapparal. The California lilac (*Ceanothus Thyrsiflorus*) predominates. It presents a beautiful sight when in bloom. It commences to bloom at the foot of the mountain, and a zone of blue extends upward day by day till the summit is reached. Only a small portion of the apiary is shown in the view, as I have 320 colonies. The range does not yield phenominal crops, but we seldom have an entire failure, and it has, perhaps, during the past four years, made as large an average as any apiary in the county. J. J. Rapp.

Ventura, Cal., March 1.



J. J. RAPP'S APIARY, MATILIJA, CAL.



LOOKING UP THE MATILIJA.

Our readers who have our back volumes will find, by turning to the issue for Jan. 1, 1889, a lengthy description of this canyon, with the Ojai hot springs, etc.; also an excellent picture of the mountain scenery. They will also remember an account of the visit we made last January, when Mrs. Root was along. Before taking my bath, friend Wilkin and I pushed ahead up to an apiary beyond the hot springs. The proprietor, however, was not at home. I felt sad to think that we could not go any further, for if we did we could not reach home by night; and just now it seems to me as if I could not stand it unless I could make certainly one more visit to this wonderful canyon, taking time enough to explore it to my heart's content.

The apiary presented in the picture is one just beyond where we commenced to retrace our steps. The trees, with their dense shadows, and the beautiful shrubs, are covered with foliage clear up to the mountain-peak. You can not see it in the picture; but in the photograph the soft feathery foliage, some of it almost equal to the down of the ostrich feather, makes some of the views rival any thing to be found in our cultivated gardens. Up, up, up, those great mountains loom, until the sunshine is so cut off that sunrise and sunset are but a few hours apart, even during a summer day. In the other picture the canyon opens out, giving one a view of the mountain-peaks beyond; and away up here, where it would seem a horse and buggy would never travel (and I think they never do travel, unless it is in the river-bed during low water), somebody has started a home. Yes, and it is a real home, even if it is away from civilization; for if you look closely, just between the two buildings you will catch a glimpse of a figure. Some woman has consented to go away off here in the wilderness, and make a veritable home indeed. I suppose friend Rapp stays out here only during the honey season, for you will notice his letter is dated at Ventura; but it seems to me, as memory goes back to those days of enjoyment, that there is no place on earth where the natural scenery has stirred my soul as those glimpses during my brief visit to the Ojai springs in the Matilija Canyon. Ordinarily Mrs. Root is completely used up by a buggy-ride of only eight or ten miles; but on this occasion she rode nearly if not quite forty miles, and felt scarcely a bit of fatigue. I ascribed it to that soul-stirring scenery that I felt sure *must* lift her as it did myself almost away from earthly things. She says, as she looks at the pictures, and memory goes back, that it seems almost like a dream; but it was a *beautiful* dream, and one whose memory will long be cherished. Friend Rapp, if you continue to hold forth we may make you another visit still.

LADIES' CONVERSAZIONE.

WOMAN AS A BEE-KEEPER.

Our space is usually so crowded with original matter that we generally do not find room for papers read at conventions; but the one read by Mrs. J. N. Heater, of Columbus, Neb., at the annual State convention of the Nebraska bee-keepers, is so pertinent and to the point that we reproduce it for this department.

Personally, we see no occasion to draw sex, race, or color lines in our calling, the whole matter resting entirely, as it does, in one word—adaptability.

Life is a free-for-all race, and I never did feel willing to grant to the "lords of creation" exclusive right to any thing, and I always contended that I had just as good a right to whistle as my brother had to sing, and exercised it.

We all know the most famous milliner in the known world, as well as the most noted cooks, are men. They have invaded our territory, and, worst of all, carried off the laurels. So, by way of retaliation, we have a perfect right to cross any boundaries. I have never considered it a compliment to woman to be asked if she could make a success of bee-keeping, as it casts a strong reflection upon her mental as well as her physical ability. I always believe any man or woman capable of accomplishing whatever any other man or woman has accomplished, until they have tried diligently and made a failure of it.

There are three all-essential requisites for either man or woman to possess in order to be successful bee-keepers; viz., grit, grace, and generosity. Grit is called to a severe test when one poor season after another follows in unbroken succession for a number of years, and it takes long sighs and close figuring to make the ledger pages balance. Grace is to be exercised when, after your tenderest care and all your sentimental talk about your "little pets," these same little pets administer to you a stinging rebuke, into which they have thrown all the venom at their command, because, perchance, you have dared to meddle with their affairs. And generosity is to be practiced in full measure when your competitor attempts in any manner to appropriate your customers to his own profits, by giving him full details as to his duty, and forgiving him for his wickedness.

In this one pursuit we are all aware that the master can not dictate to the worker, and perhaps this very fact has more to do with woman's success in the business than any other one thing, so used has she become to watching for "just the right time" before she ventures to give her command. She carries the same precaution into her apiary, where she must as closely watch her opportunity before making a demand for any thing if she expects to obtain it.

No woman is so stupid as to suppose for a moment that, if she were to give her bees sections early in the spring, they would go right to work in them, simply because she was the master—or mistress—and they were working for her. Oh, no! She has worked on that line too long for that. She will commence by being real good to them. She will overhaul every frame in the hives, putting them into the best possible condition; then, if they are short of stores, will give frames of well-ripened honey carried over for this very purpose, or feed them tempting sugar syrup, either of which will cause them to build up rapidly—which is just what she wants them to do. When she has beguiled them into filling their hive to overflowing with bees, and has take precaution to have it so at a time when she knows there will be an abundance of honey-producing plants in bloom, she continues her kindness to them still further by giving them a case of sections all nicely filled with foundation; and the poor deluded little dupes rush into those sections pell-mell and fill them with honey in less than no time. That's just what that deceitful woman has been plotting for since early spring, and she gets it.

I need not enumerate the many women in foreign lands, as well as our own, who stand with those at the very head of our business. Aside from those who are writers as well as apiarists, and who are well known to us all through their well-written articles, there are hordes of practical women patiently working away in silence who are in our ranks, and making a success of bee-keeping.

These are but a few thoughts, briefly touched upon, and we now leave it with the wiser ones to suggest further why we should or should not enter into this field of labor to possess it.

THE LIQUOR-TRAFFIC.

SHALL THE UNITED STATES GOVERNMENT PUSH THE LIQUOR-TRADE INTO HEATHEN LANDS AS IT WOULD ANY PRAISEWORTHY AND LAUDABLE INDUSTRY?

Prove all things; hold fast to that which is good.

Very few of my "sermons," as my friends are pleased to call them, have called forth more comment than the one with the above text; and the fact that every letter received thus far, whether on one side of the question or the other, has been characterized by such perfect fairness and kind Christian courtesy, that I am compelled to say from the bottom of my heart, "May the Lord be praised that we have so many good and pure men in our land so ready to hold the fort against the stream of iniquity that seems destined to keep rushing in against us." We have space for only two of these letters; and after these two, I think it will be best if the other good friends will excuse us for dropping the matter for the present.

Friend Root:—I have just read "Ourselves and Our Neighbors" for November, and am much interested. Doubtless you will receive numerous comments thereon, and I am minded to have my say among the rest. I know it is hard for all to see things alike, and I often say, let a man have what views he will on religion, politics, or what not, so long as he is *honest* and *seeks* to be *intelligent* in his advocacy. I must respect them, howsoever contrary they may be to my own.

They are few whose opinions command so great respect from me as your own, all because of their simple, charitable, yet, withal, *earnest* advocacy; and it is this, above all else, that makes me wish that you, and all like you, with your mighty powers for good, might be active politicians in the true and best sense of the word.

You confess your ignorance of political and governmental affairs, and express a wish to become better informed, in all of which you again command my highest esteem. They only can be saved who feel their need of salvation. Nevertheless, "I have somewhat to say unto you."

You hint at Christian duties regarding citizenship; you express your patriotism, and you declare your faith in God for the righting of governmental wrongs; yet, after the most careful reading, I fail to learn from your sermon (I use this word because of its adaptability) whether, in your opinion, I ought, on next Tuesday, to vote the Republican, the Democratic, the People's party, or the Prohibition ticket, in order to advance Christ's kingdom in this glorious land of ours. We take pride in the fact that we are a self-governing people; yet, if I am not mistaken, there is only one little moment in the whole year that you and I exercise our kingly prerogative. We cast our ballots, and thereby exercise our divinely imposed duty of self-government. For another whole year we are utterly shorn of personal authority; yet we are responsible to both God and man for *all* the consequences of our *delegated* power. I feel that, in casting my ballot, I have a grave responsibility resting on me. I earnestly desire to cast it on God's side, effectively if I can, but, if not, then as my earnest protest against the Devil's side.

We claim our land as the Christian's land. Can there, then, be any better way of preaching Christ Jesus than in stirring up God's people to a proper sense of their duty to hold our land for Christ, and to oust the Devil and all his hellish crew? Are Christians who pray "Thy kingdom come" in the line of duty and consistency when they delegate their kingly power of governing to parties and politicians who have been and are turning over our land to Satan by legalizing and licensing a traffic that is one of the chief, if not the greatest of obstacles to Christian progress? I believe God never does any thing for us that we can and ought to do for ourselves. With all reverence for Almighty Power, I am free to declare he can do nothing for an indifferent, lazy people, no matter how many nice prayers they may say.

I believe the evils of intemperance will be promptly banished from our land when God's people set about doing that for which they pray. But people can not be forced into the right way. Such as you, with your charitable zeal, are called of God to persuade men to come up to the help of the Lord against the mighty.

Now, friend Root, as I said before, I am entirely ignorant as to your political affiliations. For aught I know you may be as earnest a Prohibitionist as myself; but if so I heartily wish and pray that you may be led to make it a practical part of your Christian doctrine and teaching. J. M. Brown.

Wheelersburg, O., Nov. 3.

Mr. A. I. Root:—After reading, on page 809, what you say when you "felt desperate," I would suggest that you re-read in a back number your own sermon on the text: "Not by might nor by power, but by my Spirit." In Russia it is possible that the Czar, by the exercise of absolute power, might inaugurate and carry forward a reform that was not approved by a majority of the people; but in this country the government is merely the agent or the servant of the people, and is utterly powerless to enforce reforms not approved by a majority of the people. The "moonshiner" who murders a revenue officer is held for trial where the crime is committed, and is usually tried and acquitted by a jury of his friends. The enforcement of law in any community depends largely upon the people in the community. Before the advent of "local option" a saloon could not live in Oberlin, while in other towns the saloon thrives in open defiance of law.

Educate, elevate, reform the people, and the government will be reformed. It is to be regretted that so many reformers are so careless in handling the truth. This statement, that the government "runs every distillery just as much as it runs the postoffice," may fairly be characterized as a falsehood. It is just as fair and just as truthful to say that the State government runs your factory and market garden. At certain times an officer calls on you to list your property for taxation; and as a part of the machinery required *to secure the tax on whisky*, a government officer is in constant attendance at the distillery. A "government distillery" is a distillery that pays, *according to law*, the taxes levied by the government. God is certainly not on the side of the distillery and saloon. Is it not probable that God is also not *fully* on the side of the reformer who neglects to be strictly truthful? R. M. REYNOLDS.

East Springfield, O., Nov. 7.

HEADS OF GRAIN

FROM DIFFERENT FIELDS.

BEES MAKING THEIR HOME IN AN ORANGE-TREE.

I thought I would write and tell of a rather uncommon swarm of bees I found the other day. No one around here has heard of it before, although you mention it in your A B C as sometimes happening in California, so I thought you might like to hear about it. I was working in my brother's grove; and as I passed an orange-tree I heard a loud buzzing noise. At first I thought it was flies, but looked in the tree and saw a large piece of honey-comb about a foot long and half a foot wide, hanging from a branch. At first I could not make it out; but I soon found that the bees had pieces of comb in other parts of the tree. A lot had dropped down and caught on a lower branch. The bees were working on it, and seem to be doing pretty well. They seemed to be very tame, and did not try to sting at all; in fact, a man put his hand in and pulled some bad comb out from underneath, without disturbing them at all. The tree was a star orange-tree, which grows thick right to the ground. It was about 8 feet high, and was almost in the center of a 60-acre grove which has had no flowers in it for eight or nine months, and so had no special inducement for them to stay. Judging from the amount of comb, they must have been there about three months, and it is a wonder it was not found before. We (my partner and myself) hived it last Tuesday. At first the bees were rather wild, and tried to sting; but we soon smoked them quiet. I think there must have been robbers there before we came. The bees stayed in the hive all right, but we shall probably have to feed them, as they did not have much honey. W. M. FRITH.

Lane Park, Cal., Nov. 12.

HOW TO MAKE SUGAR SYRUP THAT WILL NOT GRANULATE, WITHOUT HEAT.

Mr. Root:—In response to your letter in regard to making syrup by the cold process, I beg to state that I make the syrup for Mr. Deardorff, as well as all we use here in the store, by that process, as it is by far the most satisfactory, since it does not granulate nor sour. Go to a druggist and get a half-gallon percolator and fill it with granulated sugar; then pour on water, and allow it to percolate. You will find this to produce a *heavy* syrup, and superior to any made by the boiling process.

Canal Dover, O., Nov. 7. CHAS. HAAS.

[We are not acquainted with a percolator, but would be of the opinion that it would be too expensive for the average bee-keeper. We once recommended feeding bees with a syrup made by pouring cold water on sugar. It answered very well; but we obtained better syrup by the use of hot water, and we believe all bee-keepers now pretty much agree with us.]

FIELD CLOVER.

Prof. A. J. Cook:—I send you herewith a branch, root, and bloom of a weed to be named. It grows from two to three feet high, and blossoms in October, and some years furnishes quite a little amber honey of good body and quality. Tell us through GLEANINGS something about the plant. Here it goes under several local names. It can be found growing all through our high yellow pine lands. A. F. BROWN.

Huntington, Fla., Nov. 5.

Prof. Cook replies:

This is a very interesting plant. It belongs to the pulse (or bean and clover) family, but looks very much like an aster, or composite plant. It is known in the botonies as "field clover," or *Petalostemon corymbosus*. Gray says, "In Southern pine barrens, it is a very pretty plant." It resembles the asters so closely that I had hardly a doubt of its affinities until I showed it to Prof. Wheeler, when, upon looking at it, I found, as Prof. W. told me, that it was really a leguminous plant. A. J. COOK.

Ag'l College, Mich., Nov. 16.

DO BEES GATHER HONEY FROM MORE THAN ONE SOURCE AT ONCE?

I have seen it asked in your journal, "Do bees carry in honey from different kinds of flowers at once?" This last summer I was in a potato-patch, just as it was in blossom, and I noticed a bee gathering honey. It would fly from the potato-blossom to the wild mustard, and so on till it at last flew off in the direction of the apiary. I am sure from this that bees do carry in honey from different kinds of flowers at a time. WILLIAM PECKHAM.

Solsville, N. Y., Nov. 26.

[When honey is scarce from all sources, bees are pretty apt to get their nectar where they can. If basswood is in full bloom, and the blossoms are yielding well, the bees will notice nothing else, as a rule. A few will be found working on clover, simply from force of habit, even though more honey could be obtained from the basswood.]

BEES AND FRUIT.

We clip the following from the Query department of the San Francisco *Examiner* of Nov. 3:

To the Editor of the Examiner SIR: 1. Will honey-bees puncture through the skin of sound grapes to gain access to the nectar? 2. Why were laws passed compelling bee-keepers to move their bees outside the limits of fruit-growing districts?

East Riverside, Cal. A. F. UNTERKIRCHER.

The editor of the *Examiner* replies:

[1. No. They have no instrument that will puncture grape-skins. If you doubt this, try the experiment of shutting bees up with sound grapes. They will be unable to get any nourishment from the grapes, and will starve to death if kept there long. 2. A case of misinformation. The grape-growers have seen bees empty grapes of their juice, and, without investigating further, have decided that the bees broke the skins.]

QUEENS TO AUSTRALIA.

We clip the following from the Toowoomba *Chronicle*, Australia:

A few days ago Mr. Alex. Bain, of Eton Farm Estate, who is an enthusiastic bee keeper, received an Italian queen from Mr. A. I. Root, the famous bee-keeper of Medina, Ohio, U. S. A. The royal insect was carefully packed in a neat little wooden palace, with 40 workers as companions, and supplied with a store of candy. The journey from Ohio to Toowoomba occupied 37 days, and the queen arrived in perfect health, but 27 of her companions died on the trip. Mr. Bain hopes to have some Italian colonies in operation this year.

Will bees smother if left under a snowdrift, with hives out of sight, sealed covers, and fly-hole open clear across, and ground descending enough for good drainage when the snow melts? M. NEVINS.

[Probably not, but we should prefer to keep the entrances clear. Melting snow might make an entrance sealed with ice.]

OURSELVES AND OUR NEIGHBORS.

Poverty and shame shall be to him that refuseth instruction; but he that regardeth reproof shall be honored.—PROV. 13:18.

I have felt moved to take up the subject expressed in our text because of some trying experiences I have had during the past few months. It is on a matter which I have written and spoken about many times before; and it is a matter that is troubling and vexing the souls of some of the best of our American people just now. What I mean is this matter of work and wages. It seems to me that, in the nature of things, a great part of humanity are destined to work for somebody else. The farming class of community are, perhaps, more their own bosses than almost any other calling; but yet the farmer can not do very much business unless he employs help of some sort: and then comes this vexing matter of finding somebody who will do a fair and honest day's work, without constant supervision. If the farmer works *with* his hired man all day long, there is comparatively little trouble; but, like other occupations, the employer oftentimes gets a hired man for the express purpose of doing his manual labor that he may be thus spared to look after and oversee other things pertaining to his occupation. There are thousands of people out of work, and they do not seem to know *why* they are out of work. The worst part of it is, they won't believe it, won't accept or won't heed it if you tell them plainly *why* they have nothing to do; and others say right out that they would rather continue to loaf than to come right down to business. What I mean is this: Many of our best and most successful farmers—T. B. Terry, perhaps, heading the list—declare they will have no man at work on their premises who drinks, swears, or uses tobacco. Well, a great part of those out of work would rather remain out of a job than to give up the things mentioned. Oh yes! they will *promise* to give them up, or keep the fact concealed, that they are guilty of any of these bad practices; but sooner or later, like murder, it comes out.

Now, I am not going to dwell on the above three things in this talk just now. There is something that is continually coming up that is just as bad as any of the things I have mentioned, and I do not know but it is a little worse, and perhaps it keeps more families in suffering and want than the things I have mentioned—that is, when they do not all go together. The thing I have in mind is a lack of conscience—a want of honor or manliness: a disposition to cheat in one way or another just as soon as an opportunity is open. The fore part of our text hits exactly the outcome—"poverty and shame." The habit of cheating is exactly like the habit of strong drink or swearing, or giving way to temper, or using tobacco. It gets a hold upon the human heart, and it is like pulling teeth to weed it out. At first I thought of saying what I intended to say to-day, directly to our helpers. When they get their money Saturday night it comes to them in an envelope. On the outside of this envelope is a record of the number of hours and minutes each has worked during the week. I do not know how many of these helpers read these neighborly talks in GLEANINGS; but the ones who are in the habit of cheating in their work probably do not read them. I have many times asked them the question. No wonder they do not like to hear any of this kind of talk. Neither do they, as a rule, attend the noon services. Although it is not often the case, even professors of religion do *sometimes* so lose their spirituality that they get into these habits; and it is a sad fact to chronicle, that *women*, as well as the men, get led astray in this very way. I know I am finding fault with my fellow-men; but may God give me love and charity while I find fault in the line I am doing to-day. At this season of the year, as usual, great numbers are coming to me for employment. It seems as if the number were greater now than ever before. A good many quite good workmen in different trades and occupations come to me and propose to work for any wages I think proper to give. Perhaps they have learned by past experience that I am in the habit of giving liberally for fair, honest services, no matter what the agreement may be. I like to do a little *better* than I agree; and by the way, friends, this is one of the grand secrets of success in this world: Be careful what you agree or promise to do, and then do a little better than you agree. The world is full of people who fail continually in sticking to their promises and agreements; but those who make it a point to do a little *more* than they agree to do, right along, are scarce, I tell you.

Our people all work by the hour. For many years they marked down on a slate when they commenced work and then marked on the other side of the slate when they stopped work. Thus each one was permitted, as far as the demands of business would admit, to commence and stop when he chose. With the great bulk of our help this plan worked very well. Nine-tenths of our people, or perhaps even mere, would mark down on the slate exactly when they commenced and when they stopped. But during all these years when we practiced this plan, there was almost constantly *some* person—perhaps some of the younger ones—who would discover the slate was not watched very closely, and they would begin marking a little earlier or a little later, as the case might be, so as to get more pay for the time they actually worked; that is, if they came ten minutes after seven, and nobody was around to watch, they would mark it seven o'clock. When one was caught at this he was watched; and when we found it was a regular plan, and not a mistake, the matter was referred to myself. Oh what tussles with the powers of darkness I have had in this very line! Just after the verse I have quoted for my text, there is one containing this startling truth: "It is an abomination to fools to depart from evil." Just think of it, friends! Did you ever hear a truth more pointedly or vividly expressed? The one who is caught in this sort of deliberate cheating seems to take it for granted that he must get out of it by lies, no matter how many it takes to get him out. As I write now, I can not remember that I ever found a person who fairly and squarely owned up to this sort of thing. The text I have quoted calls such people "fools." It seems hard and strong, does it not? Well, just listen: Almost every sinner in this line follows pretty much the same track. At first he says, "Oh! I worked overhours the other day, and did not make any charge for it, and so I just marked a little more time on my slate, and thought it would be all right." My reply is, however, "Look here, my friend, several of us have been watching you. You cheated in your time not only Monday, but Tuesday; and on Thursday you cheated in the forenoon and afternoon. We have also watched you, and taken pains to find out whether there was any overwork or any thing that might possibly excuse you for this sort of irregularity. We have let the matter go until you are fenced in on every side. There is nothing for you to do but to confess your sin and ask God to forgive you, and then turn over a new leaf and do better." You would think the above would bring a confession, wouldn't you? But it does not. I have told the culprit that I had had long experience in this matter; that the excuses he made were the same ones that others had used years before; but it did not make any difference, and I have told at least *three* people that the only explanation that could possibly be given was, that they had taken leave of their senses, at least for a little time, and did not know what they were doing; and I guess each one of them preferred to accept that, or tried to make me believe, that it was a case of "temporary insanity" rather than confess that he had tried to *steal* from the one who was so kind as to relieve his distresses by giving him employment.

A word about this matter of acting the detective in order to find out beyond mistake whether a certain one had deliberately gone into dishonest practices or whether it was only a mistake that might occur on one side as well as the other. Doing this sort of detective business has done more to wear me out and break down my nervous system than almost any thing else in the world. Some of you may say, "Why, brother Root, why do you bother with such people at all? I would not have them on the premises, not even if they would work for nothing."

Well, I have thought that way a good many times. I am afraid Satan has suggested it to me very often. The trouble lies right here: I once knew of a church that was going to have its members pure, and they commenced turning people out. I finally began to remonstrate, but was told, "Mr. Root, we are going to purify our church, even if we expel every last member." You know how it turned out. They kept on expelling until the church was shut up; and by some queer freak it seemed as if those they kept in were worse than those they turned out. I do not mean by this that all our hands are given to *cheating*—God forbid. I simply mean that, if we turned off every one who uses tobacco, or cheats in his time, or is forgetful, or makes mistakes, or is slow, or quick-tempered, or given to puttering, or who is crabbed, and difficult to deal with, or who lacks in judgment, etc., we should not have anybody left. The greater part of these faults and failings can be cured. A plain, kind talk with the one who is at fault usually results, as the text has it, "He that heareth reproof shall be honored." People who own up to their faults and failings will get over them, as a rule, unless it is this grievous sin that I have spoken of—a deliberate determination to *steal*.

Well, after having had so much trouble with the markings on the slate, we procured, at much expense, a registering time-clock. This we have had for three or four years. When one comes to work he selects the envelope from the rack, with his name printed on it, pushes it under the stamp attached to the clock, strikes the knob with his hand, and the hour and minute are printed on the envelope. He can not change it nor make it any different, even if he would, because the time clerk would see it if he did. No changes are to be made without her permission or sanction. This gets us out of the trouble, doesn't it? Oh dear me! It gets us out of *one* kind of trouble, and perhaps it makes it a little *harder* for those who are disposed to be dishonest and untruthful. In exhorting people to temperance, we are often met by remarks like this: "You will never stop drunkenness in this world. If you shut up the saloons they will get it out of the drugstores. People will get it by hook or by crook, when they want it badly." Now, I do not believe much in this sort of logic; but there is an element of truth in it, after all. You can not make people honest by building fences around them. We recognized this in the beginning of our business; and we have fewer locks and keys —fewer rigid rules, and fewer detectives, than perhaps any other similar institution. We rely upon the honor, integrity, and conscience of our people, and we get along pretty well. I wish I might stop here, because I dislike to drag things to light that might wound like cutting with a knife. But sometimes the knife must be used: and I feel that what I have to say may help perhaps thousands to break away from their sins, and may be to get better wages than they are getting now. The text says, "He that regardeth reproof shall be honored;" and the reproof I am about to give you may be needed by a good many people who are working for somebody else.

During the past few months we have had dull times in our factory. Only a few were kept in each of our rooms, and it would have been policy for us to keep only the most faithful; but sometimes circumstances seem to demand that we should favor some who can hardly take care of themselves unless they have something to do. Common humanity would seem to demand this. I have learned to dread dull seasons, because at such times there is almost always a sort of half-heartedness about the work. People do not accomplish as much when they are making up work ahead, as when orders are crowding them; therefore loose ways get in upon us. We have had a political campaign, and there was quite a temptation to talk politics instead of attending to work. Is this right? When you have hired out to work for a man, and have agreed on so much a day or hour, is it right to use those hours in discussing the political affairs of our country? Perhaps there is a revival meeting in your neighborhood. After you have sold your time to a certain neighbor for an agreed sum of money, is it really honest and Christianlike for you to occupy this time in talking about religion? I think not. Of course, we expect everybody to be courteous and neighborly, even if he is employed by somebody else; but whoever hires out, should, if he wishes to get the best possible pay for his services, regard the contract like a promissory note—"For value received I promise to pay —— hours of work for my neighbor." If your neighbor *hires* you to assist in a revival of religion, why, then, of course, it is your duty to carry along your Bible, quote texts, exhort, etc.; but if the understanding is that you are to build fences, I think he would have very much more *respect* for your *religion* if you, during those working hours, refuse to discuss or even consider the matter of politics, or religion either.

There is, however, a kind of religious talk that I think no employer would object to, even during working hours. Suppose one workman should say to his companion, "Mr. Brown, if I were a church-member, as you are, I hope it would prevent me from using my employer's time to light my pipe, and take a smoke just as you are doing now." I do not mean by this that I would want men to stop their work to discuss—at least not at any very great length—the tobacco habit. But it would be quite proper and right to talk religion this much: "Thank you, Mr. Brown; but I will not take any tobacco if you please. I started out a few days ago to be a Christian, and I think a Christian ought not to use tobacco."

In times past, on these pages I have more than once spoken in very high terms of women as wage-earners. My conscience has troubled me sometimes for fear I had given them too exalted a position, or that I had, may be, gone to the Quixotic extreme of imagining that all womankind are saints. If any one has ever had that opinion of me, I think he will get over it when I finish what I am going to say now. Some way it always seems as if it were ever so much worse for a *woman* to act dishonestly than for a man; and therefore some of my sorest trials have been in dealing with women in this very line. Where work is all done by the hour, as it is here, there is a constant temptation to certain ones to want to get in as many hours as they can, or, at least, have the hours counted, and at the same time do the least possible amount of work. I have known women who got so hardened in this sort of thing that it seemed almost as if they made it a *study* to see how they could do the least amount of work, and make it count the largest number of hours. In the basement to our stores there are several rooms that are not very well lighted. They were too low to get in large windows, and the small windows are often covered with piles of merchandise. Well, more than once I have found women in these dark rooms, as we call them, standing in idleness, that they might get credit for more time. The foreman of their apartment had told them that it was quitting time; but by loitering about they could get in fifteen minutes or half an hour more. As they received only small pay, and as this was a matter of only four or five cents, I often let it go, thinking it was not worth making a fuss about; but it was just as I have been telling you. If a sinner escapes detection in little things, he gets bolder and bolder. One of these women accomplished so little that the foreman told me he asked her to put her work all in one place so he could see how much she did during the afternoon. At night she showed a very good record, and he was beginning to think he had been mistaken, and that she was doing more work than he supposed. Pretty soon, however, one of the other hands said he saw her carrying a quantity of finished work from another part of the room to mix in with her own. One who gets so conscience-hardened in *minutes* soon lays hold of *property* without scruple.

In many of our departments, where work will permit of it, we have hands to work by the piece. In this case they do not keep their time at all, and one might think the problem was solved, and that piece work ended the temptation. Don't be too sure. I have known women —yes, bright-looking intelligent women—who, when they worked by the piece, would, if opportunity offered, mix in finished work that they were paid for the week before, so that, when the foreman came to count their work, they got pay the *second time* for the *same work*. Now, dear friends, please bear with me when I lay just one more sin to the charge of womankind. I have known at least two who, while doing the very things I have been describing, would be singing fragments of hymns to try to make me believe they were honest, and loved God's word and his holy teachings—"stealing the livery of heaven to serve the Devil in."*

It pains me to the heart to tell these things; but my prime motive in doing it is, that these poor deluded friends may know that such things can not be done without its being known. When I let it pass, thinking it was a little matter to make a fuss about it, others noticed it and came to me about it until it seemed to be well understood, and yet the poor deluded woman thought nobody noticed or *knew* what she was doing. Sin blinds not only the conscience, but the eye and the judgment. Sometimes it is hard to convince an intemperate man—that is, after he gets sober—that he went reeling through the streets so that everybody noticed it and talked about it, while *he* was perfectly sure that he walked as straight and natural as need be. So with the whole round of sins. Satan persuades the poor victim that he has succeeded in deceiving the whole wide world, when ordinary good judgment and common sense ought to have told the poor deluded one what a fool he was making of himself. I have wondered what must have been these people's thoughts at these times, of God's all-seeing eye; and then it comes back home to me, the fact that I, too, am a sinner. My faults and inconsistencies, perhaps many of them, in God's sight are *almost* as bad as the ones I have been narrating. There is a strange passage in the sixth chapter of Genesis, to the effect that, at one time, God almost or quite repented of having made man. My grandfather, who was a skeptic, used to be fond of quoting it—that the infinite God, the great ruler of all and over all—did things at times that he was *sorry* for after. I used to wonder why such a passage should be in the Bible; but now I begin to get a glimpse of the great truth, even in that strange expression. God honored us by making us free agents; and if we go wrong, and commit sin, we do it of our own free choice. We are all sinners. We all choose voluntarily folly and sin, rather than truth and wisdom; and when I look into my own heart, recognizing that God knows it all, just as I know it all, I have sometimes of late thought it would be nothing strange or unreasonable if he, an infinite being of truth and love, should have been sorry more than once that he ever created and gave liberty of thought and action to such a poor miserable stumbling sinner as A. I. Root. But let us not be cast down, dear friends. Let us only feel the more earnestly that we need a Savior; oh! I need a Savior more than I can tell you. I need the help and influence of Christian friends and companionship; I need the spiritual uplifting power of the prayer-meetings and the church of God. If I should stay away—if I were to receive no Christian counsel or encouragement from friends around me, it seems to me as if I should surely be lost. I need your prayers, I am sure, and we all need the prayers of each other.

Now, if there is one among my readers who is working for wages, and has been tempted into any of the things I have mentioned in this talk, let him read our text again. "Poverty and shame shall be to him that refuseth in-

---

*And, by the way, such spectacles as this do more to injure the cause of religion than perhaps any other one thing in the world. I have seen young people whose sense of honesty and truth had been outraged by the sight of professors of religion who did such things as I have described until it seemed as if they would be embittered toward Christianity for the rest of their lives. They say, "The whole thing is just cant and hypocrisy; and so much of it is put on for the sole purpose of getting a better chance to steal, that I beg to be excused from ever going in with that crowd at all." I want to put just one more thought in this footnote. How much is a man or woman worth in business who goes to work in the way I have described? When we hire people we do it with the understanding that they shall labor for the building up and development of the institution they are working for. While they put money into their own pockets, by so doing they are to put at least *some* into the institution. It is expected to be a little richer or better off for the work they do. Now, instead of enriching their employer, suppose they bend all their energies toward transferring his property into their own pockets. How much wages should such a one receive? Had he not better pay double—yes, four times as much, or more—for an honest and conscientious person of the same ability? Most surely. And now, friends, I hope you are catching a glimpse of the reason why at least a great many unfortunates do not succeed in getting work.

struction." I hope some instruction is to come to you in this talk to-day. Please believe your old friend when he tells you that, if you give way to these temptations, even in the slightest degree, they will grow upon you like weeds in a rich soil; and please believe me, too, when I tell you that your friends as well as your employer probably know all about it. May be they think it is a small matter—too small to make a fuss about; but they feel sad and sorrowful while they note it. It is a great blemish on your character—yes, a thousand times worse than some physical defect, especially among womankind, who like to appear well and look well before the world. Why, dear sister, this thing mars not only your spirituality and enjoyment in life, but it hurts you more in the eyes of all good men and good women than any physical defect you can think of. And then remember, again, that last great truth that I have been trying to teach you to-day: "It is an abomination to fools to depart from evil." Suppose, after what I have told you, and even after having read this printed page, these friends of whom I have spoken should go right on, continuing to do this very thing when opportunity offers. Why, you would say such a one is a fool and an idiot, and that is just what the Bible says.

I have felt troubled about speaking thus plainly to-day; and I have prayed over this neighborly talk perhaps more than over any other one during the whole past year; and as I close, I am breathing a prayer to the great Father above, that he may so bless and sanctify this poor work of mine that its faults and blemishes may be passed by and only the grains of truth be gathered in. And may the result and summing up of it all be, through Christ Jesus, to you a merry Christmas and happy New Year; for please believe me, dear friends, when I tell you there can be no *real* merry Christmas, nor happy New Year either, without *honesty* and *truth* in our hearts, that we may make there an *abiding-place* for the love of Christ Jesus—he who came down to earth on Christmas day to be a *Savior* to all who feel the need of something that *only* a messenger from the great God himself can give.

NOTES OF TRAVEL

FROM A. I. ROOT.

OSTRICHES AND AN OSTRICH-FARM.

Just as sure as you are alive, I finished up our travels in Arizona without saying a word about the ostrich-farm. It is a few miles out from Phœnix, among the alfalfa-fields. You see, the alfalfa is just the nicest feed in the world for ostriches. They will live and thrive on it when it is green; and if put through a cutting-box when it is dry, they eat it with great avidity. By the way, there is something funny about the way the ostrich eats. He will gobble up a great lot of dry alfalfa, and, of course, it has got to go somewhere; so it forms itself into a sort of wad, or ball, and then commences making a slow passage—perhaps I had better say voyage—down that long cranelike neck. Imagine a lump as large as your double fist slowly making its way from the head of the bird toward the body. The neck is so distended that the lump of food is plainly visible all the while the ostrich is eating. Well, we hired a livery team and drove out. The streets in Phœnix and the roads in the suburbs were just about as bad as or even worse than any that can be met here in our Medina County clay; and as we were there during the rainy season, it was a pretty big task to get even four miles out of the city. We crossed quite a number of the irrigating canals that one meets everywhere, and found the ostriches in an alfalfa-field bordered by beautiful large branching cottonwoods that grew on the banks of an irrigating canal. We first got sight of the old original trio of birds. Imagine a Brahma rooster so tall that his head is almost as high as a man on horseback, and then you can get an idea of something what the "papa ostrich" looks like. In disposition, however, the Brahma comparison does not apply. The disposition of the game-cock is not quite the thing either, for the ostrich is more like an enraged bull when you go around the inclosure. We decided not to go inside of his domain, as his looks and actions were so warlike. But in an adjoining lot was a brood of chicks. Some of these chicks were pretty nearly as tall as the old fellow, but they were much more slender, and they had a timid look and demeanor that made one think of young turkeys. As we approached their inclosure they came up also, and peered at us with great liquid eyes. Their slender legs did not look as if they could do one much harm; but notwithstanding, I was a little afraid of the strange creatures. My brother Jess, however, crawled through the fence, and went out among them. They evidently expected something to eat. Some of them acted a little bit vicious; and I think quite likely that, if we had run and acted freightened, they might have pursued us.

A young ostrich is, in many respects, unlike any other kind of the furred or feathered tribes. They have a peculiar tipping and swinging gait that tempts one to laugh; and it is more like a young miss of sixteen, who begins swinging herself and putting on airs, than any thing else I can think of. I hope none of the young misses who read GLEANINGS will take offense at this, for I want to say that young ostriches are remarkably graceful—at least most of the time. Jess tried to see whether they would shoo, like geese and turkeys. They did not shoo very well, but he finally got them to cantering down the lot; and when they spread their wings so as to catch the breeze, it was one of the finest sights that ever met my eyes. I should think there were ten or twelve in that brood, of nearly full-grown chicks.

Pretty soon my eye caught sight of another inclosure with a low picket fence around it. Of course, no ordinary fence would hold a full-grown ostrich. He would straddle right over common farm fences. This last inclosure, however, was about the sort you see around a garden to keep chickens out. And what do you suppose we found inside? Why, a whole brood of chicks not much larger than ordinary turkeys. Oh! but weren't they pretty! and they were just as cute and full of fun as a lot of well-fed and mischievous chickens and turkeys. They would pretend to fight each other, and then make the oddest grimaces, spreading their wings, and jumping as if they were in their native deserts. You may wonder where the Kodak was. We managed to corner up the chicks so as to get the group, and I had snapped it once, and was just getting ready for them again, while Jess was making them gallop down the lot. I must remark here, there was no dwelling near the ostrich-farm; and as our time was limited we had not found out where to get permission to make our investigations. The temptation was so great, when we got in among the birds, that we were really making ourselves at home. At just the crisis mentioned, however, the keeper came on the scene. I presume he was not very much pleased to see a couple of strangers chasing his birds, and pointing some sort of machine at his fine brood of chicks. I made haste to make my best apology, and to tell him we were going to take their pictures, and that we would send him a magazine describing his ostrich-farm. They have a little coop to stay in nights; and as it was winter time, the keeper drove them into their inclosure and locked them up. I think these fellows were only four months old. The next brood, if I remember correctly, was nearly a year old. The old trio were full grown. An ostrich is worth from $500 to $1000. Their eggs are worth $5.00 each, and are about as large as the head of an infant. You remember what I said about eggs in Arizona hatching while on the shelf in a store.

Well, this temperature makes it easy to hatch out ostriches at just the right season of the year. Even if the mother-bird does not cover all the eggs, the chances are very good for a good hatch. I think, however, that four or five chicks are as many as they get at a hatching.

There were two, and perhaps three, mature females. I wanted a Kodak view of the old bird himself; and I wanted, above all other things, to get him while he was on the "war-path." I suggested to the proprietor that I could go around on the opposite side of the lot, crawl through the fence, and have my Kodak all ready, so that, when he discovered I was right in the inclosure, I could take his picture when he got the proper distance from me, and crawl through the fence before he would have time to tear me to pieces and chew me up. The keeper thought it was a rather risky experiment, but you know it is right and proper that we should take some risks in the pursuit of science. He told me I had better look out, but said that, if I was willing to take the chances, all right. I was considerably excited at the time; but I remember of thinking I would like to take the picture also of my brother Jess as he watched proceedings. From his childhood up he has always been full of mischief, and he has not got over it yet, even if he is toward fifty years old. Ever since he was a small boy, a peculiar comical expression comes into his face when any mischief is going on. Mother could always tell when we had been doing any thing wrong, by a look at Jesse's face; and when I proposed to brave the lion in his den, and then get out through the fence with my apparatus before he could catch me, Jess just entered into the spirit of the adventure with his old-time boyish love of sport and mischief. He kept close to me, ready, I suppose, in the event that he and the keeper would have to turn in and help to deliver me from the enemy. I crawled through the fence, and challenged the foe to mortal combat. Oh! but you should have seen him bristle up and paw the gravel, like an infuriated beast. He spread his wings, and pranced up and down, taking that peculiar ostrich step I have been trying to describe; and then he came down on me like a rush of mighty waters. It was a hard cross to take my eyes from the bird and look at my camera in order to get it properly adjusted. One thing troubled me—I could not see just how near he was when I snapped the button. I succeeded, however, in getting every thing much to my heart's content; and even though I hadn't the hundredth part of a second to spare, I said to myself, "There, old fellow, that picture will be worth a hundred dollars if you succeed in getting through that hole in the fence before his majesty demolishes you, Kodak and all." I pressed the button. There was a confused rattling inside of the camera, that did not seem quite right. I hoped, however, that it was the excitement of the moment that made me imagine it; and, didn't I just get through that fence lively, as my Kodak rolled in one direction and I in another, while I picked myself up out of the alfalfa! There was my enemy rubbing his breast against the top rail of the fence, and fairly dancing up and down while he bellowed forth his rage. He tried to reach me with his open mouth and fierce beak; but as the head of a full-grown ostrich is not very much larger than your double fist, the head itself is not very formidable. It was those wicked clawlike heels of his that he was itching to twist around so as to give me a stroke.

In many respects an ostrich resembles a fierce domestic fowl. His preamble before doing any thing is something like the strutting of a turkey gobbler; but he kicks with an aim that is usually unerring when no obstacles are in the way. I do not know whether they have ever killed human beings or not; but I have been told they would in short meter if a man were unarmed. If he has a club in his hand, a good muscular stroke across the long slender neck disables the ostrich; but at the same time it knocks a thousand dollars or more out of the pocket of the owner; so the keeper has two reasons to avoid "picking a quarrel" with his birds. I do not know whether the mother-ostrich scratches for her chicks, and leads them about like a mother-hen, or not; but I would give quite a little sum of money for the privilege of spending a day or two where I could see the chicks when newly hatched, to learn more of the strange instinct that governs these wonderful creatures.

Do you ask where the pictures are? Well, my dear friend, when we got to New Orleans I had my Kodak overhauled, and was told that, when I snapped my machine on that big ostrich, I had got to the end of the roll of films—that is, I had taken my sixty pictures. When I snapped it that last time the film pulled off, and every one of the views taken on the ostrich-farm was spoiled. You see, I lost my book of instructions that goes with the instrument, and therefore I did not keep account of how many pictures I had taken, and hence this mishap. I I am very sorry indeed that I can not present you the pictures I so fondly anticipated having accompany this description. But if Providence permits, and I continue to feel as well as I do now, I think the readers of GLEANINGS may feel sure that they will get them some time.

HIGH-PRESSURE GARDENING.

BY A. I. ROOT.

SOMETHING ABOUT WAGONS.

Every market-gardener, and I should say every farmer, who expects to do very much business, should have at least two wagons. During the busy time a successful man can not afford to lose the use of his team, and possibly that of a hired man, because the wagon must be repaired. We have a blacksmith of our own, right here on the premises; but notwithstanding that, we can not well get along without an extra wagon. A good many times our regular wagon contains a heavy load, when a sudden demand from some other direction makes it necessary to unload. I bought a very stout low-down wagon, or truck, that was a great deal out of repair by being left out in the wet, for only $8.00. By paying out nearly as much more on it, we have a wagon that does nicely for emergencies; and, when something gives out on our regular wagon, the team is hitched on to this one, and the work goes on with scarcely a moment's delay. This gives the blacksmith plenty of time to do a good job; and if the woodwork is to be made new, it can be painted even two coats before it is put on to the muddy roads again. By the way, I never can stand it to see a big heavy team, with a good stout efficient man, loafing at the blacksmith shop while repairing is being done. If the shop is several miles off—I wouldn't have a shop several miles off—I would have a hired man who could do a little at it; or, better still, I would get some tools and do it myself on stormy days; and right here is where the second wagon comes in. If your help is low-priced help, it is not so bad. By the way, when I have a good stout team and a good wagon I can not bear to put them into the hands of an inefficient man. If you have a man who is competent to look carefully after the feeding of his team in order that they may do their best, and look carefully after the way the wagon is used—one whose judgment is good as to how much the wagon and horses can draw—you will need to pay him a pretty good price; and when you have got a good, willing, and intelligent man, it is of the utmost importance that he and the team make every hour count, when the weather is suitable. Why, a few days ago it became necessary for us to move some coal, and I found they were starting out with a little over a ton at a load. After I got things fixed to my notion, our big team moved *two tons and a half*, and the roads were not good either. With the former loads there was no profit in the transaction. With two tons and a half, however, we made a very good thing of it.

HAPPY SURPRISES.

After the poor season for outdoor garden-stuff, happy surprises come in very acceptably—at least, they do with me; and the one I have found in the last few days is a big one, I tell you—at least, it is a big one to me. I think I shall have it for a Christmas present. You know how much I have said about hot springs, and lamented that none of them were ever used for heating greenhouses, outdoor beds, or any thing of that sort. Sometimes it has almost seemed as if I *must* have a hot spring of my own. But then, in the region where the hot springs are found there is not any need of greenhouses, and greenhouse products would not command the prices, probably, that they do here. I did not know how I could get a hot spring here without digging a well so deep as to strike the subterranean reservoirs. A jet of gas might do it, but either would cost a good deal of money. Now, what do you think? God has sent me a hot spring right at my own door. Nay, better still: it started right in that new greenhouse I told you about in last issue. The temperature is not that of one of your mild springs, either, for the water is almost boiling hot. I had been praying that God would bless my efforts in both teaching and practicing intensive gardening; and the blessing came within three or four days after that prayer. Oh! there is not any thing miraculous about it after all; but it is a precious gift, and I am very thankful for it, nevertheless. When I described that new greenhouse on page 893, I told you it was to be warmed by exhaust steam running in tiles back and forth under the beds. Exhaust steam, you will remember, has been already for more than a year running under a part of our garden. Well, about a hundred feet from the greenhouse was this six-inch tile that carried the exhaust steam. After the building was all finished it occurred to me that I had made no provision for *water* inside of the house; and then I remembered that I might have laid a water-pipe at the same time this six-inch tile was put put in, for at one point it runs very near one of our underground water-pipes. Then it occurred to me that I could dig up the tile at a point inside of the greenhouse, and push a ¾-inch galvanized iron pipe right back through the tile until the end came to the water-pipe. It was a short job to do it; and while doing it it did occur to me that the exhaust steam would warm the water so that it would be about the right temperature to water the plants. Well, you may think we were all stupid; but it was a downright surprise to me when I first opened the valve, to find the water was almost boiling hot. Before we could put it on the plants it would have to be cooled off. I was as badly off as those friends in San Jacinto, who ran their spring water into a great big tank, and waited for it to cool off so it would be fit to drink. At the same time, *they* purchased wood to warm the rooms of their sanitarium. We did not do so badly as that, I remember of thinking that, if I had a hose long enough to go clear around the greenhouse, and then turn on the water very slowly, it would probably be cool enough by the time it reached the sprinkler. Then I said, "Why, you old stupid! just run an iron pipe clear around the greenhouse, and your building can be heated by hot water." I supposed I scratched my head a little then, for pretty soon it burst upon me that I could put my hot-water pipes overhead, right under the sash, and then I should have overhead heating while the tiles under the beds would give bottom heat; and the very day the idea came into my mind, with the assistance of one man the pipes were up. But I was stupid, even then. I supposed the water would have to be shut off so it would just come in drops, or perhaps run in a small stream. I thought that, if I let it run at all fast, so much cold water going through the pipes would chill them off. Now, the surprise was, to find that the heat liberated in the condensation of that exhaust steam through 100 feet of tile would keep a good-sized stream of water, and the pipes as well, so hot they could not be touched with the hand. After warming my house, there is hot water to spare—enough to run ever so many more hot-beds or greenhouses. My friends suggested, however, that, as the engine runs only during the day, my hot water would be missing when most needed, during the night. But even this is not true. The tile that carries the exhaust steam is, perhaps, 18 inches under ground. The ground is hot, and stays hot, not only over night, but over Sunday; and this Monday morning, when the thermometer stood at only 15° above zero, I was agreeably surprised to find my hot-water pipes quite warm, although a steady stream of water had been going through them day and night. You see, to get the highest temperature in the pipes, we gauge the size of the stream of water by the valve; and to keep the pipes the warmest, it needs a pretty good-sized stream at the outlet. You might think at first that this would draw on our reservoir supplied by the windmill; but the windmill has been standing idle, waiting for a job, for months; so the exhaust steam and the windmill together have given me a spring of boiling water that costs absolutely nothing.

I have mentioned all this in detail, because it does seem to me that it is almost a sin to pay out so much money for coal and wood while the exhaust steam from thousands of engines is going to waste out in the open air. When you see steam issuing from any sort of shop or factory, and spouting out into the frosty air, you can remember that tons and tons of coal are being sent away in vapor. All that is needed is to send this jet of exhaust steam into a line of common draining tile, of size adequate to the amount of steam. Of course, we do not want to put a back pressure on the engine. Lay these tile a couple of feet under ground. They had better be on an incline, the lowest point being right near the engine. This gives a draft of hot air. At the end of the tile there can be some sort of cheap chimney or stack, although this is not absolutely necessary. Now, run your iron pipe or pipes along through this tile so as to receive the latent heat from the condensed steam; then take this hot water into your greenhouse, dwelling-house, or anywhere else you choose, and regulate the heat by governing the amount of water that escapes. I presume likely the same hot water might be used over and over again after heating the plants or dwellings by hot water; and this would be quite a saving over taking cold water from the hydrant and letting it go to waste while still hot. By the way, does anybody know of a firm that makes an apparatus for heating buildings *by hot water* by utilizing the heat from exhaust steam? You will notice that the apparatus I have described is a very cheap one —that is, when made as ours is made.

THAT NEW GREENHOUSE.

So many questions have been asked in regard to this that we are preparing some engravings for it in the next issue. This morning, Dec. 13, I noticed a large squash-plant coming up in one of the beds right over one of the six-inch drain-tiles. This tile is at least two feet below the surface of the bed where this vine came up; and the glass above the bed is not more than two feet distant from the plant; yet a temperature of 15 above zero did not affect tender plants in the least. Perhaps I should repeat, that all our experiments with exhaust steam, under ground, are with a ten H. P. engine. During the daytime it rarely does as much as five H. P.; but after the electric lights are put on in the factory it runs up to fully ten H. P., and then the greenhouse and cold-frames get a good warming-up that takes them safely through the night.

THE VALUE OF A BAROMETER.

Our new greenhouse, as you will remember, is covered with sashes—45 in all. Well, while we were building it we got them all in place one afternoon. None of them were fastened, however. In fact, we had not as yet got ready to arrange the fastenings so that they could be stripped off in the spring, as I have mentioned. There was not a breath of air stirring, and every thing seemed to indicate that there would be no danger in leaving them over night, any way. But I ran over and looked at the barometer. To my astonishment, it was away down. Yes, the fall in only a few hours had been such as to indicate a tremendous storm of some sort. I hurried back, got some long strips of wood, and I presume some of the men thought I was rather vehement about having those strips wired over the sash so securely. Next morning, when I first met one of the foremen his remark was, "Well, I declare, Mr. Root, I am agreeably astonished to see your greenhouse all safe and sound. When I heard that fearful blow last night I felt sure those loose sashes would be blown all over the neighborhood." And so they would have been had it not been for the barometer's timely warning. I have had a little experience with wind taking loose sashes, and it has taught me to watch the barometer when we stop work at night, under such circumstances. Its timely warning saved me a good many dollars.

ONION-SETS IN THE OPEN GROUND ALL WINTER.

I never fail to have onions winter all right. In the first place I set them deep; then if they freeze up I take my double wheel-hoe and put on the turning-plows, straddle the row, and throw the dirt *to* the onions; then in the spring, if I wish them to mature and make large onions, put on the curved hoes and throw the dirt *away*. H. C. CARMICHAEL.

Morristown, Tenn.

GLEANINGS IN BEE CULTURE
A Journal Devoted to Bees and Honey and Home Interests.
Illustrated Semi-Monthly
36 Pages 7×10
$1.00 Per Year.

And God saw that the wickedness of man was great in the earth, and that every imagination of the thoughts of his heart was only evil continually.—GEN. 6: 5.

QUITE by accident this is a good deal of a California number.

DEC. 8, 1892, we sent to the India famine sufferers $7.65 more, which had been contributed by readers of GLEANINGS.

PROF. COOK has just sent in another article on the sugar-honey matter, in reply to the article of Charles Dadant and others; but it came too late for this issue, and will therefore appear in our next—Jan. 1.

EVERY thing in California depends upon the amount of rainfall at this season of the year. Reports show that copious rains are beginning to come, and California bee-keepers are wearing a broad smile. Given enough rain, and the honey-crop is assured.

We have not made any very great promises as to what we were going to do in the way of getting out a holiday number; nevertheless, we have been trying to get up something a little extra, and will let the pages of this journal speak for themselves. We have been obliged to add eight extra pages in order to get in the extra matter.

WE are pleased to announce that George E. Hilton, of Fremont, Mich., was elected to the State Legislature by a large majority, running about a hundred ahead of his ticket. We don't know any thing about his politics, and, indeed, it were better that we do not, because we as bee-keepers all over the country can make our congratulations more hearty in the hope that he is on *our* side.

WE have given our readers our usual full and copious index. That for the engravings is particularly full, and shows that GLEANINGS is just what it claims to be—an *illustrated* periodical. The peculiarity of the index to *correspondents* is, that it is smaller than those of former years. This shows that we now have fewer and better contributors—those whom our subscribers mention the most in their letters, and whose writings they seem most to enjoy.

THE last mail from Australia shows that nearly all the queens we sent to that country in the early fall arrived in good condition, and that, too, despite our fears to the contrary on account of the cholera quarantine regulations and official officiousness from the foreign postal authorities. On account of our success we have several orders on hand to send more queens by next mail. It is now too late, on account of the cold, to send any until next spring—say about May 15th. Queens to Australia go via San Francisco, and the trip over the mountains at this time of the year chills them to death. Our success in mailing is chiefly owing to the fact that we are careful to select the *right* time of the year.

RAMBLER, during 1893, will send some views and sketches of bees and bee-keepers in Mexico, as well as of other portions of the Pacific Coast. He is a veritable rambler—he can not keep still. He likes to get around and see folks, and we are glad that he does, because he is somehow able to make all the rest of us see with his eyes. The Langstroth biographical sketches will continue, with illustrations, into 1893. The Reminiscences will have more to do with bee-keepers and bee-keeping of the early days. There will be brief sketches of the lamented Samuel Wagner—the first editor of the *American Bee Journal*, and one to whom the bee-keepers of the present day are indebted much. You can not afford to let your subscription run out.

MORE ABOUT COMB FOUNDATION.

IN calling attention in our last issue to the superior quality of Root's foundation, as now made, it was not our purpose to detract from the popularity of Dadant's. The testimonial inserted may be understood in that way, as we examine it more carefully; but we did not so intend it. Our friend whom we quoted may be an enthusiastic admirer of the Home of the Honey-bees, and overstated the matter, for we can hardly believe that his statement would be borne out by the facts generally. Dadant & Son make excellent foundation, which is acknowledged the standard, and they deserve the patronage of those in want of this requisite of all progressive bee-keeping.

"BEES, HONEY, AND HOME INTERESTS."

WE copy the following editorial from the *American Bee-keeper:*

> Old reliable GLEANINGS IN BEE CULTURE will have to change its name unless it sticks closer to the text. The November 15th number contains twenty-nine pages of reading-matter (exclusive of advertisements), and there are fourteen pages of matter which does not bear on the subject of bee-keeping in the least. Wherefore is this thus?

Quite true, neighbor Merrill; but there are some other things that are true also which you have failed to mention. When I occupied so much room in our issue for Nov. 1, I distinctly stated that we had printed and added to that number eight *extra* pages, so that *no one* might *find fault*. Another thing, GLEANINGS is *not* devoted exclusively to bee culture. On the front page of every issue you may read, "Devoted to Bees, Honey, and Home Interests." Now, inasmuch as it has over ten thousand subscribers, and has had for several years, and continues to hold its own, it seems to me it is doing *pretty* well; is it not? A. I. R.

THE WHEEL, FOR CARRYING BURDENS.

ON page 849 I spoke about a low-down package-carrier. Well, I have been using one for about a month. It supports a sack of mail right over the front wheel. The principal part of the weight comes on the foot-rests, and it can be lifted off from the machine or dropped back in its place in a second. With it I carry 60 lbs. of mail with ease. You see, that would make a pretty fair wheelbarrow load, and you sit on top of the wheelbarrow and ride, besides. Thus far this winter neither ice, snow, nor rain has prevented me from making my five daily trips to the postoffice—half a mile away—and back again. Yesterday, the 13th, the stone pavements were so icy that people kept on their feet with difficulty; but the inflated rubber tire carried me safely with a big sack of mail, even over that icy flagging, where it was considerably on an incline. You see, by taking upon myself the office of messenger-boy I get regular open-air riding every working day, no matter what the weather may be, and I scarcely ever finish my trip without a feeling in my heart, "May God be praised for this wonderful new gift." I think it is going to give health, strength, life, animation, and enthusiasm to thousands during the new year of 1893 that is just before us. A. I. R.

THE WASHINGTON CONVENTION.

EVERY patriotic American citizen, at least some time in his life, should make a pilgrimage to the Mecca of his country—Washington. There may never be a better opportunity for some of the bee-keepers to visit that city, and take along their wives. If they feel that they can not afford to go, simply for what they might "pick up" at the convention, they certainly can for the sake of the many interesting things they will see before and after in the city. We have had a number of inquiries about this meeting; and if this means any thing there will be a large attendance.

We expect to be present ourselves—that is, A. I. R. and E. R. R.; and it will give us pleasure to shake hands with our old friends, and any new ones that we may run across. Do not forget that one of the pleasures of all bee-conventions is the usual hand-to-hand face-to-face meetings with bee-keepers whom we have known long over the printed page, but whom we have not seen before. Some of the best things we ever got at conventions were picked up between sessions from some of the brethren who felt a little shy abont telling what they knew before the whole convention.

OUR ROUTE TO WASHINGTON.

IN Ernest's editorial in regard to the convention in Washington, on page 896 of last issue, when he suggested that bee-keepers should get together at Pittsburg on the *morning* of the 26th, it never occurred to him that the 26th was on Monday, and that, in order to make said point of meeting, some of us—perhaps many of us—would have to travel on Sunday. It is a little unusual, and it seems to me that it is a little unfortunate, to have the first day of the convention on Tuesday. But, on the other hand, if we should put it on Wednesday, the last session would come on Friday afternoon, and many of us could not well reach home by Saturday night. This would necessitate Sunday travel, or else spending both Saturday and Sunday in Washington, starting home Monday morning. I suppose this is a matter that devolves upon the conscience of each and every individual; and yet the question will come up, "Bro. Root, some of us would like to know what you and Ernest propose to do under the circumstances." We propose to take another route, in order to avoid Sunday travel, and this will take us into Wheeling at 7:45 P. M. From there we shall take a train direct to Washington, leaving Wheeling, *via* the B. & O., at 12:25 A. M., and arriving at Washington at 12:10 P. M. A. I. R.

L. L. LANGSTROTH — IMPORTANT TO ALL BEE-KEEPERS.

ON page 913 of this issue we take pleasure in presenting to you a large portrait of the Rev. L. L. Langstroth. This picture was taken by our own artist here in Medina, seventeen years ago, when Mr. Langstroth was making us a visit. It shows him in the prime of his life, and the possession of health and mental vigor, and is a very good likeness of him as he then appeared.

It is Christmas time, and many of us would like to have some little Christmas souvenir to place in our homes. We know of nothing more appropriate in the home of a bee-keeper than a nicely framed picture of father Langstroth. Surely there are hundreds who would like this picture. Mr. L. is, at present, beginning to suffer again from his old head trouble, but not so much but that he can enjoy and appreciate any little attention or service from his bee-keeping admirers. Now, to help him in his declining years, and to give him a slight token of the appreciation of bee-keepers all over the land, we will sell these portraits, mounted on large sheets of plated paper, suitable for framing, for 25 cts. each. Of this amount, 20 cts. will be credited to Mr. Langstroth's account, and 5 will be retained by us to cover the cost of printing, mailing, etc. If you send in your orders promptly, we will try to see that the pictures reach you—at least the most of you, if not too far distant, before the 25th—Christmas.

THE MEETINGS OF THE NORTH AMERICAN; WHO ARE ENTITLED TO ATTEND.

Several have written, asking whether they would be permitted to attend the convention of the North American, at Washington, if they were not members. Most assuredly, they would be welcome. Quite a few have attended the meetings in the past, without enrolling themselves. The president always invites those present to become a member by handing in a dollar, because there are expenses to be met; and it does seem is if those who come and listen ought to be willing to pay that much for the privilege of hearing the best thoughts from the best men. Ladies are always enrolled without paying. As editor of Gleanings we will take the responsibility of saying that, should there be any one who comes on this invitation, pays a dollar, and then, at the close of the convention, thinks he has not received the worth of his dollar, if he will present himself to us before we leave for home, with a statement of the fact, we will refund the dollar at our own expense. But let us emphasize this fact: The convention is open to everybody. If any one feels as if he can not afford to pay the dollar down, and become a member, let him come anyhow. Most of us have to pay from $10.00 to $25.00 dollars, including railroad fare, for the privilege of attending this North American convention; and the very fact that we do so is good evidence that we think it pays.

QUEEN-BEES NOW ADMITTED THROUGH THE MAILS TO ALL THE COLONIES OF AUSTRALIA.

On page 782, for Oct. 15, our readers will remember that there was some doubt as to whether the postal authorities would allow queens to be sent to New South Wales, Australia. Mr. W. S. Pender, of West Maitland, N. S. W., has kindly interested himself in the matter of keeping the authorities well posted as to the needs of the bee-keepers, and we are now gratified to see that he has been successful to the extent that there is a strong probability that queen-bees will hereafter be admitted to *all* the colonies of Australia. The following letter, received from the secretary, at the general postoffice at Sydney, will explain itself:

General Postoffice,
Sydney, Oct. 5, 1892.

Mr. W. S. Pender:—Adverting to my communication, dated the 23d of June last, I am directed to intimate that intelligence has now been received from the London postal authorities to the effect that the British Postal Regulations prohibit the transmission of any living creature through the post, and it is not considered expedient to make an exception in favor of bees, even if sent by "letter" post. It is pointed out, that, according to the International circular, issued by the Berne Bureau, experience shows that bees, forwarded by post, sometimes remain alive from seven to ten days, but may die after the third or fourth day of the journey, and that, therefore, apart from considerations of postal expediency, there is reason for believing that it would be impossible to arrange for an exchange of live bees by post between England and Australia, the transit being too long for bees to reach their destination alive. As regards the interchange of live bees *intercolonially*, and between this colony and the *United States of America*, I am to state that the different Australian colonies have given their consent to the interchange of bees, and steps are now being taken which, it is not improbable, will lead to the colonies generally agreeing to exchange the articles in question, with other Union countries (including the United States of America), willing to exchange such articles with them. Of course, as previously stated, any packets containing bees, received here from America, will be delivered.

I have the honor to be, sir, your obedient servant,
S. H. Lambton, *Secretary.*

We hope our correspondent will keep us posted as to the further developments.

"SLUMGUM"—WHAT DOES IT MEAN, AND WHENCE DOES IT COME?—SEE P. 911.

Dr. Miller wants to know the derivation and meaning of "slumgum." It is a word that was coined by H. R. Boardman, to designate a certain leavings, exclusive of the wax, after melting old combs. We, in turn, gave further countenance to the word by allowing it to be used repeatedly in our columns, as it was suggestive, and seemed to express better than any thing else the article which it was made to represent. We might substitute "wax refuse" or "wax residue," as both would be more legitimate English expressions, but not so precise. "Wax refuse" or "wax residue" might mean the ordinary collections of pieces of combs and little particles of burr-combs that will accumulate in the apiary, but which have not yet been subjected to a refining process. The word "slumgum" gives an idea of dirt skimmings, or refuse, of the poorest sort, and at the same time hints at a trace of wax, propolis, etc. We hear of the slums of the city. "Slum" is derived from the word "slime;" and Webster, in his second definition, defines it as a mucilaginous or glutinous substance. Gum—well, we all know what that is. It is a good old-fashioned orthodox word. As new processes come up in the arts and sciences, it becomes necessary at times to coin new terms; and while these terms should not be incorporated *ad libitum* in dictionaries, they have their proper place in glossaries devoted to the science to which they appertain. All our correspondents have so far seemed to accept "slumgum" at once, and so far have adopted it as a term that is both precise and suggestive.

In reference to the quotation-marks, Dr. Miller failed to make them in the copy, and so we made a guess, to the effect that the last sentence was an inference of his own. The reader will notice that the paragraph in question (p. 875) was *all* the work of Mr. Wykoff.

APICULTURAL TERMS IN THE INTERNATIONAL DICTIONARY IN NEED OF REVISION; DR. MILLER AT WORK ON THE STANDARD DICTIONARY.

Webster's International Dictionary, while it is a work of which we Americans may justly be proud, and while it is unusually accurate and full in its definitions and terms when applied to the arts and sciences *in general*, in the line of apiculture it sadly needs revising. When the work was under preparation, and fearing that, unless something were done, the new Webster's International would contain the same incorrect apicultural terms as the old one, we wrote to the publishers, calling their attention to them, and asking them to submit such terms for revision to Dr. C. C. Miller, a bee-keeper and a scholar—one who would be entirely competent to do the work satisfactorily, not only to bee-keepers, but to men of letters. The publishers acknowledged our letter, and promised to do something of the kind; but it seems that nothing was ever done, and the work came out with many inaccurate definitions, and noticeable omissions that ought to have been incorporated, because they are now a part of the language. For instance, "extracted honey," now used in all market quotations, and used on almost every table in the land, is not mentioned at all. Again, "bee-glue" is defined as a "soft, unctuous matter with which bees cement combs to the hives." "Unctuous" means greasy or oily. Every bee-keeper knows that propolis is not greasy, and that bees do not with it fasten the combs to the hives; they have another use for it. A superficial observer, however, might make such a definition as given above by glancing at the inside of an old box hive. Again, "bee-bread" is defined as a "brown, bitter substance found in some of the cells of honeycomb." Bee-bread may be brown, red, yellow, orange, or green. If it is ever bitter, we were not aware of it. Once more, the International makes no distinction between a *colony* and a *swarm;* and the definitions of both are exceedingly faulty. We might go on and give a number of other examples, but these will suffice to show that apiculture has not received the same painstaking care in that magnificent work that other subjects of equal importance have done.

Funk & Wagnalls, of New York, are preparing a dictionary that will fully rival Webster's International. Being aware of the errors in the International, we begged of the publishers of the Standard not to go and do likewise, and referred them to Dr. Miller. They replied very courteously to our letter, and stated that it would give them pleasure to follow out the line of our request. A few days ago we received a letter from Dr. Miller, announcing that he had been employed, by the firm above mentioned, to do that work. The long and the short of the whole matter is, that we shall have at least one dictionary that will give our industry proper recognition; and bee-keepers, at least for the present, when this work comes out, will take pleasure in referring to it as the "Standard" so far as it relates to the subject of bees. Perhaps we should add, in this connection, that Dr. Miller would be glad of suggestions from bee-keepers generally as to what words should be properly incorporated in the dictionary.

THE COWAN RAPID EXTRACTOR; WHO FIRST DEVISED THE HINGED-DOOR PRINCIPLE OF THE COMB-POCKETS?

A FEW days ago we received a copy of a patent on an extractor, taken out by G. W. Williams, Oct. 7th, 1879, the same having been sent us by the attorneys, presumably, of Mr. Williams. His solicitors, understanding that we were manufacturing the Stanley extractor under license, called our attention to the fact that the Stanley patent, issued in 1884, was an infringement on the Williams patent, under date of 1879, and in proof referred us to the second claim, which reads as follows:

> 2. In honey-extractors, the shaft *b*, provided with radial arms *c*, and hinged foraminous comb-holders *d*, constructed and combined for operation substantially as described and shown.

By referring to the drawing, we see that this claim covers all extractors, the Cowan as well as the Stanley, the revolving pockets of which are hinged at one side, door fashion, in such a way as to allow the combs to be reversed without removal from the extractor. While the attorneys for Mr. Williams had evidently in mind only the infringement of the Stanley, it is evident that the Cowan also would be an infringement, *providing* it was not made and described at a prior date. Now, we have made and sold some few Cowan extractors, and we expect to sell a good many more, and hence we were interested at once. By referring to that excellent little book, "The Bee-keeper's Guide," written by Thomas William Cowan, we find that he made and introduced the Cowan Rapid reversible extractor, *the same thing* we are now making, in 1875. For further evidence we referred to the *British Bee Journal* for that year; and on page 117, Oct. 1, we find the same described in detail. The editor, after describing a number of ingenious devices which were exhibited at the Crystal Palace Bee and Honey Show, which took place Sept. 21, 22, and 23, 1875, says this of the Cowan Rapid:

> The "Rapid" also, by Mr. Cowan, was a much more ingenious affair, and attracted considerable attention. It is all iron; and its revolver, which has no perpendicular spindle, has two wire cases, hinged at opposite corners, into which the unsealed combs are to be placed; and when the honey is extracted from the outside cells, their inner sides are swung round to the approximate sides of the revolver, and the honey slung out without their removal being necessary. There may be some little difficulty in getting the combs into the wire cases, as, unless quite straight and even, their sides would be abraded; but a little ingenuity on the part of the inventor will overcome that difficulty. One other defect, as it appears to us, consists in the fact that, to obtain the reversal of the combs, a portion of each side of the square revolver is taken up, which otherwise would permit of the use of larger combs within it. Some outside observers considered that the iron revolvers would soon become rusty, and spoil the honey, forgetting that the machines were simply patterns, new, and hand-made, and probably unaware that all future machines will be perfectly galvanized throughout.

The description is so minute and accurate, and as it occurred just exactly four years *before* the date of the Williams patent, any court to whom the matter might be referred for decision would at once declare the Williams patent null and void for want of novelty. This would also render null and void a similar claim in the Stanley patent, although it would not affect the validity of the claim covering the *automatic* reversing.

THE BEE-KEEPERS' UNION—SHALL IT BE REORGANIZED? AND IF SO, HOW SHALL IT BE DONE?

IN response to our editorial on page 897, of last issue, Mr. Newman has sent in the following, the same being also submitted to other bee-papers:

> I have carefully read the editorial on page 897 of GLEANINGS for December, and, as therein requested, I will offer a few remarks on the matters at issue.
>
> Mr. Root desires me to "state in a circular letter, the desirability of having the constitution changed, and submit to the members of the National Bee-keepers' Union a voting-blank, with return printed envelope," etc.
>
> The advocates of the measure should certainly be the ones to show the "desirability of the change;" and if Mr. Root, or any other one of its advocates, will undertake that duty, I will quote it in my forthcoming Annual Report and call for a vote on the subject. As I have never *advocated* the measure, it would be quite out of place for me to champion the measure before the members of the Union. I will act in an impartial manner, and refrain from

the discussion, simply to get the full, free, and unbiased vote of the members of the Union.

I hope to have my 8th Annual Report ready about Dec. 20, and then the whole thing can in it be laid before the membership, and the matters to be voted upon can be included in the regular voting-blank for officers. This can be done without extra expense to the Union, and will settle the whole question in a legitimate and authorized manner.

Bro. Root very generously offers to send out 10,000 circulars, voting-blanks, and return envelopes to his subscribers. Why, that will cost $100 for postage alone, besides printing and stationery. Why not request all the bee-periodicals to devote one advertising page to the Union, and print thereon a circular and voting-blank? Then ask the subscribers to fill up the voting-blank and inclose with a dollar for annual dues, to the Manager. That will save hundreds of dollars, and still get at all the intelligent and progressive bee-keepers of America at one and the same time.

If this meets the views of the advocates of the measure, I will get up a voting-blank, and send an electrotype of it to all the bee-papers, for publication as suggested.

I will send this letter to every bee-paper, and endeavor to get the views of the editors; and, if the proposition is agreed to, we will send the electrotype in time for the first issues of each periodical in 1893.

I will also do any thing that seems wise, which may be suggested by other persons; and I hereby request any one who has suggestions or ideas on this subject to offer, to send them to me at once—for "in the multitude of counselors there is wisdom," said an ancient sage. **Thomas G. Newman.**

Chicago, Ill, Dec. 9, 1892.

Mr. Newman is quite right. It would not be the thing for him as General Manager, or, as it were, presiding officer, to take sides in the discussion. If Prof. Cook, the one who proposed in the *American Bee Journal* for Nov. 17, page 665, that the Union accept new functions, will make a motion, stating the desirability of the change, we will most cheerfully second it. If this motion is submitted to the General Manager, in writing, the same can then be again submitted to the members of the existing Union, with whom alone rests the power of modifying the Constitution, by vote.

With regard to submitting blanks and circulars to our subscribers, Mr. Newman's plan is a better one—more feasible and practicable; and Gleanings will cheerfully give space to the consideration of the question, in the manner indicated.

The time is growing exceedingly short before the convention takes place in Washington; a proof of this will, therefore, be submitted to Prof. Cook direct, to save time.

Mr. Newman's management of the Union has been so wise and efficient, that, if it will be out of the question for him to act as chief, he certainly should be retained as assistant or adviser, in the event of the change; then, if necessary, let younger blood do the work.

THE WASHINGTON CONVENTION; REDUCED RAILROAD RATES.

The following, in regard to the North American convention which is to take place at Washington, D. C., on the 27th, 28th, and 29th of this month, has just come to hand from the secretary, W. Z. Hutchinson:

THE NORTH AMERICAN BEE-KEEPERS' CONVENTION.

The North American Bee-keepers' Society will hold its 23d annual convention, Dec. 27, 28, and 29, at the Randall House, corner Pennsylvania Ave. and 15th Sts., Washington, D. C.

This hotel is new, handsomely furnished, and first class in all its appointments, and is the most centrally and beautifully located of any hotel in Washington. The regular rates are $3.00 a day; but to those attending the convention they will be only $2.50. Besides this, if only fifteen members stop at the house, a hall in the hotel will be furnished *free*. Otherwise, the charge for the hall will be $5.00 per day. Of course, there are other cheaper hotels to which those who choose can go. Rates as low as $1.75 can be secured. Or a room at $1.00 a day can be obtained, and meals taken on the European plan.

The convention will be held when all railroads will give a round-trip ticket for the price of one and one-third fare. It may be well to explain, however, that these rates are given only for *local* traffic. In other words, a person who has to pass over more than one road can not buy a *through* ticket and take advantage of the reduced rates. In order to take advantage of the reduced rates he will be obliged to first buy a round-trip ticket over his own road; then, upon reaching the next road, buy one over that, and so on. It may be possible that a limited return ticket could be bought nearly as cheaply as to pay these locally reduced holiday rates. Let all consult their ticket agents in regard to this before buying their tickets. The trunk lines would have granted reduced rates (one and one-third fare), but there must be 100 persons present. Should there be less than 100 present holding railroad certificates, the reduced rates would be withheld. Should we adopt the certificate plan, and then the attendance be less than 100, there would be bitter disappointment and loss, as, had the members not *expected* to return at one-third fare upon presentation of their certificates, they would have taken advantage of other reductions. As it now is, those living on roads leading into Washington *direct* will be all right, while those coming over more than one road can manage as suggested.

PROGRAMME.

FIRST DAY—TUESDAY, DEC. 27.

Afternoon Session—2:00 p. m.—Payment of annual dues; reception of new members and distribution of badges. "President's Address," Eugene Secor, Forest City, Iowa. Discussion. "Grading Honey," Dr. C. C. Miller, Marengo, Ill. Discussion. Question-box.

Evening Session—7:30 p. m. — "Self-hivers," E. R. Root, Medina, Ohio. Discussion. Question-box.

SECOND DAY—WEDNESDAY, DEC. 28.

Morning Session—9:30 a. m. — "Detecting the Adulteration of Honey," Prof. A. J. Cook, Agricultural College, Michigan. Discussion. (Prof. H. W. Wiley, U. S. Chemist, is expected to be present and join in the discussion.) "Varieties of Bees and Their Characteristics," Frank Benton, Washington, D. C. Discussion. Question-box.

Afternoon Session—2:00 p. m.— "What the Department of Agriculture Ought to Do for Apiculture," P. H. Elwood, Starkville, N. Y. "What the Department of Agriculture Has Done and Can Do for Apiculture," C. V. Riley, Government Entomologist, Washington, D. C. Discussion. Question-box.

Evening Session—7:30.— "Shall the Scope of the Bee-Keepers' Union be Broadened?" T. G. Newman, Chicago, Ill. Discussion. Question-box.

THIRD DAY—THURSDAY, DEC. 29.

Morning Session.—Selection of place for holding next meeting. Election of officers. Report of committees. Completion of unfinished business. Question-box. Adjournment.

Just a word in regard to the fewness of the topics. Some of the topics are of unusual importance, and deserve most thorough discussion. It is very unsatisfactory to have an important discussion in full blast cut off short, and perhaps referred to a committee, in order to give room to the next topic. A full convention can bring out all the points much more fully than a few men in a committee room. One suggestion leads to another, and "in the multitude of counselors there is wisdom." The questions in the Question-box (often of importance) are frequently referred to a committee to be answered. A discussion in full convention is much more likely to bring out the truth. If any one has any topic or question that he would like discussed, and will not be present to ask for its discussion, let him write to me at once and I will see that the matter is brought to the notice of the convention. The discussion of a topic often leads to another which it would be very desirable to discuss, but lack of time prevents. It is believed that the above programme will allow a reasonable time for the discussion of these interesting side-questions that are continually springing up. **W. Z. Hutchinson, Sec.**

CONVENTION NOTICES.

The National Bee-keepers' Association will meet at Washington, D. C., Dec. 27—29. See our editorial columns.

The annual meeting of the Ontario Bee-keepers' Association will be held in the town of Walkerton, Ont., Jan. 10, 11, 12, 1893. All interested are cordially invited. W. COUSE, Sec.
Streetsville, Ont.

The eighteenth annual meeting of the Vermont Bee-keepers' Association will be held in the city of Burlington, Dec 28th and 29th, 1892. Every one interested in apiculture is earnestly desired to be present. As a bee-keepers' association we know no State lines, but will gladly welcome all that come, regardless of their residence. Programs will be published soon, for which address H. W. Scott, 125 Brooklyn St., Barre, Vt.

The Ohio State Bee-keepers' annual convention will be held in the parlor rooms of the Cherry Hotel, Washington C. H., O., Dec. 27 and 28. Arrangements are made for 1⅓ railroad fare on all roads leading into Washington; viz., B. & O.; C., H. & D.; Panhandle, and Toledo & Ironton. Also reduced hotel rates.
MISS DEMA BENNETT, Sec., Bedford, O.

The Southwestern Wisconsin Bee-keepers' Association will hold its next annual meeting in Boscobel, Grant Co., Wis., on the 13th and 14th of January, 1893, commencing at 10 A.M. All members of the association are requested to be present, as the following officers are to be elected: President, vice-president, secretary, assistant secretary, and treasurer. Blank reports will be sent to each member of the association for 1892, with instructions. A cordial invitation is extended to all bee-keepers, and especially to those who would like to join us. Each member will be notified at least one month before said meeting. BENJ. E. RICE, Sec.
Boscobel, Wis.

SPECIAL NOTICES.

DISCOUNTS FOR EARLY ORDERS.

Only two weeks remain to this month and year in which to secure the 4-per-cent discount for early orders. Jan. 1, 1893, the discount drops to 3%, and in February to 2%. We have been getting a nice lot of orders, taking advantage of these discounts, and trust we shall get many more.

NEW EDITION OF OUR CATALOGUE.

Between now and Jan. 1st we shall have a new edition of our catalogue, to the number of 25,000, ready to mail. We are also at work on the March 1st edition, which will be entirely reset in new type, and electrotyped. Of this edition we hope to put out 100,000 or more. If any desire a copy of the Jan. 1st edition, send in your request, and you will receive it promptly. There are quite a few changes from the last edition.

MORE DEALERS IN ROOT'S SUPPLIES.

Bee-keepers in Dixie can obtain many of our goods from J. M. Jenkins, Wetumpka, Ala., and those he makes himself are doubtless equally good. Those in Southern Colorado, in the vicinity of Rocky Ford, can secure what they need in our line through Henry F. Hagen, of that place, who will have a carload within the next few weeks. We have still other distributing points in view, but arrangements are not sufficiently complete as yet to make further announcements in this issue.

HONEY MARKET.

Comb honey has not been selling so readily since our last. Christmas time is almost here, and sales should be better at this time. We still have several hundred cases of the choice Nevada honey, mentioned in former issues, and we should be pleased to hear from those who need such honey.

Extracted honey of good quality seems to be very scarce, and in good demand. We can furnish extra nice in 60-lb. square cans at 10c per lb., or in 160-lb. kegs at 9½. We have 3 such kegs at Bowling Green, O., that we will sell at 9c there for a prompt order.

TRAINLOAD OF SEEDS AND BEE-SUPPLIES.

Our two carloads of bee-supplies for F. L. Posson & Son, Portland, Oregon, left here on the evening of the 13th for Chicago, where they will join a trainload of seven or more carloads of seeds from D. M. Ferry & Co., to the same firm. This special train is expected to leave Chicago on the 20th, via the C. & N. W. and Union Pacific, and will make daylight runs most of the way. You may see notices of it in the papers along the way; and those living on this route may get a glimpse of the train if they are on the lookout for it.

AUGITE STOVE-MATS, AGAIN.

Since our last issue was mailed we have sold over *three gross* of these mats, and they will no doubt make as many housewives happy. See Dr. Miller's article on another page; and if you have not already ordered one, make haste to do so before Christmas is past. Price 20c each; by mail, 6c extra; 6 postpaid for $1.40; one dozen by express, $2.00; by mail, 65c extra. Except to far distant points, a dozen will go cheaper by express. We furnish 6 dozen for $11.00, or 12 dozen for $21.00. Send on your orders.

U. S. OFFICIAL POSTAL GUIDE.

This is a book of almost 1000 pages, 5¼x7¾, with monthly supplements of about 40 pages. It is published by authority of the P. O. Department, and contains an alphabetical list of all postoffices in the U. S., with county and State, a list by States, a list by States and counties, showing the money-order offices, domestic and international, also rates of postage, synopsis of postal laws, rulings of the department, information relating to postal matters, and general regulations respecting foreign mails. It is a book that ought to be in every business office that has much correspondence. The regular price in paper covers is $2.00; in cloth, $2.50, including supplements from time subscription is received till July, '93. The large volume is mailed early in January; but subscriptions should be sent in before that time. We are able to club the paper edition with GLEANINGS one year for $2.40, or the cloth-bound edition for $2.70.

MUSHROOMS—HOW TO GROW THEM.

The above is the title of a new book published by the O. Judd Co. It is written by William Falconer. I suppose that most of you know that mushrooms are quite fashionable just now. If you pay a dollar for a dinner on a dining-room car, on any of our leading railway lines, you will be likely to see mushrooms on the bill of fare. You won't see very large dishfuls of them, even then. At present, mushrooms are selling in Boston and New York at a dollar a pound, retail. The business is constantly increasing, and more and more gardeners or florists are putting them under their plant-beds every year, but still the price keeps up; and, by the way, mushrooms are not such an expensive dish, after all. They taste more like oysters, perhaps, than any thing else, and a very few of them will make quite a dishful for a family—that is, they will give a mushroom flavor to a meat pie, or a stew large enough for an ordinary family. For our family ¼ lb. does very well; and away back here in Medina we are quite content to get 15 cts. for ¼ lb. If you want a whole pound the price is 50 cts. Since I told you about growing them by steam heat we have had them right along, and I expect to have some for supper when I get through writing this editorial. I am going to the postoffice with the mail on my wheel, however, first. You see, that gives me an appetite. May be you would like to grow mushrooms. Well, the book I started out to tell you about gives the fullest possible directions, in plain, easy language that every one can easily understand. Anybody who likes to make garden can raise mushrooms; and as they do not need a bit of sunlight, any out-of-the-way place, under the cellar-stairs or anywhere else, where it will not freeze, will grow them to perfection. The book contains 172 pages, and is full of nice pictures. The advertised price is $1.50. It seems to me rather too much, therefore I am going to offer it for $1.25, even if I do not make very much profit. I presume the publishers excuse themselves for asking a large price by saying that it is the first book of the kind ever published in America. After I have had a little more experience I will tell you how to do it, in my garden talks for the coming year. All the expense besides labor is the stable manure. Nothing else, so far as I know, will grow them. But the publishers claim that the manure is worth just as much for the garden afterward as before. It may be worth as much for some purposes. If you want the book by mail, add 6 cts. extra for postage and packing.

SECOND-HAND FOUNDATION-MILLS.

We have the following list of second-hand foundation machines which have accumulated during the past few months, some in exchange for new machines, others from those who have decided to buy what foundation they use. We give as fair a description as we can of these machines, with the price at which we will sell. We can furnish samples from any of the machines to intending purchasers.

One 6-inch hex., No. N, used a short time in our wax room; in good order; makes fdn. 10 or 11 feet to the lb. Price $10.00.

One 6-inch hex., No. M, extra-thin mill, in splendid order. Price $10.00.

One 6-inch hex., No. K, thin surplus mill, in good order. Price $9.00.

One 10-inch, round cell, No. L, in good order for light brood fdn. Price $14.00.

One 10-inch, round cell, No. I, for light or medium fdn.; in good order. Price $14.00.

One 10-inch, round cell, No. E, old-style frame; made some years ago, but used scarcely any, and in good order. Price $14.00.

One 10-inch, round cell, No. C, old-style frame; in fair order. Price $12.00.

One 12-inch, round cell, No. D, for heavy brood fdn.; roll, same size as 10-inch, only 2 inches longer; one of the original Washburn mills, in fair order. Price $15.00.

One 12-inch Dunham mill for heavy brood fdn.; not so good as the above, but in fair order; will sell for $12.00.

SECOND-HAND MACHINERY.

During the past few months we have bought up several outfits of machinery for making bee-keepers' supplies; and if any of our readers or their friends contemplate putting in machinery we are prepared to fit you out from cellar to garret with everything you need in engines, boilers, machinery, shafting, pulleys, hangers, belting, saws, etc. The following is a partial list of the second-hand machinery we have to sell. If you desire further particulars we shall be pleased to hear from you.

One 20-H. P. Fishkill horizontal engine, rebuilt, and as good as new; would cost new, $400; will sell for $200.

One 5-H. P. horizontal engine and boiler, with engine mounted on boiler, in good running order. Price $150.

One 24-inch two-roll Fay sandpaper machine, nearly new. Price, new, $450; will sell for $175.

One V-groove section machine, nearly new. This is our make, old style, with screw-feed; sold some years ago for $75; will sell now for $40.

One cutter-head, with table complete, for cutting entrances to sections. Old style, but nearly new, and in good repair. Price, new, $25.00; will sell for $15.00.

One double-head tenoning-machine, especially arranged for making the combined rabbet and miter joint of the Simplicity hive, but can be used for making sash and window-screen frames, etc. We could not build such a machine, and sell it for less than $150; we will sell this for $60.

Two extra large saw-tables for general use, to cut off or rip, with counter-shaft attached to frame; worth new, $50 each; will sell for $20 each.

Two four-piece section-machines, as good as new, they cost new, $85 each; we will sell them for $30 each.

Also a large lot of shafting, pulleys, hanger belting, and saws, too numerous to mention here.

RENEW EARLY.

The time is near at hand when the paid subscription of many of our readers will expire. Probably none of you like to be in arrears any better than we like to have you. As an inducement for you to act promptly, and send in your renewals before the time expires for which you have paid, we offer you the choice of the following premiums. Now, please note carefully the conditions on which we make this offer. Those who are in arrears can not claim a premium till they first pay up; then, if they remit for a year in advance, they may for that claim a premium. The premium must be claimed when the subscription is sent; it can not be allowed afterward. Postage for mailing, and full subscription of $1.00, must be sent to secure the premium, and it must be sent *before* your subscription expires.

The list of premiums from which you may select:

DZIERZON THEORY, a pamphlet of 50 pages, in paper cover; price 10c postpaid, or sent free on above conditions. This is something that every enthusiastic lover of the honey-bee should read.

THE CHRISTIAN'S SECRET OF A HAPPY LIFE. This book should be in the hands of every one who desires to live a happy life, and who does not? It is so popular that over 50,000 have been sold since its publication a few years ago. We received from the publishers as many as 1250 in one shipment. This edition was revised and enlarged, so that the book now contains over 200 pages. Price, cloth bound, 50 cts. In paper, 25 cts. Postage extra, 8 cts. for the cloth and 6 cts for the paper bound. A large reduction will be made in quantities. The cloth book given postpaid for two subscriptions, or the paper for one new subscription with your own renewal. Cloth edition given with your own renewal only, and 35c extra, with 8c postage; the paper edition for 15c extra and 5c postage. We have some slightly damaged paper edition that we will give free with your renewal and 5c for postage. If you send one new name with your renewal you may select any three premiums that we give for a renewal, being sure to include the postage; or you may retain 25c in cash for your commission.

PEABODY'S WEBSTER'S DICTIONARY. 25,000 words and phrases, and illustrated with 250 engravings; cloth bound. This is the one we have been selling for years at 15 cts. We thought we had done something wonderful when we offered so large a dictionary for 15 cts., but we are now able to sell them for a dime. Just think of it! Postage extra, 5 cts.

ONE-SYLLABLE PRIMER. 6x8; 48 pages, full of pictures; something that will always be wanted as long as there are children in our homes. Postage 3 cents.

POULTRY FOR PLEASURE AND PROFIT. 48 pages, and 20 illustrations. A complete little book of instructions. It treats of the best varieties for pleasure and profit; how to house and yard; how to manage; how to feed; diseases, incubation, etc. It is a 25-cent book; but by getting 1000 of them we can sell them for 10 cents. Postage 1 ct.

THE HORSE AND HIS DISEASES. By Dr. B. J. Kendall; 100 pages and many illustrations. Over 500,000 of these books have been sold, because they are so popular and complete, for a small handbook. It gives the symptoms of most diseases, and treatment for the same. This is another 25-cent book that we got down to a dime by taking 1000 of them. Postage 3 cts.

SILK AND THE SILKWORM. This is a complete work of instruction on silk culture, by Nellie Lincoln Rossiter, a practical silk culturist; 32 pages. Silk culture is the favorite pursuit of many ladies in our land; and all who are interested will find this little work very instructive. The price printed on it is 25 cents. but we sell them for 10 cts. Postage 1 ct.

NEW TESTAMENT, NEW VERSION. 434 pages, printed in nonpareil type. This should be in the possession of every student of the New Testament. Even if it does not come into common use, it is helpful to know what changes in translation the New Version gives. Postage 5 cts.

JOHN PLOUGHMAN'S TALES AND PICTURES. By Charles Spurgeon; 128 pages, and a picture on almost every page. John Ploughman talks plainly, and makes a good point in every talk. It is by no means dry reading, either. Postage 3 cts.

Maple Sugar and The Sugar-Bush

BY

PROF. A. J. COOK,

AUTHOR OF THE

BEE-KEEPER'S GUIDE, INJURIOUS INSECTS OF MICHIGAN, ETC.

The name of the author is enough of itself to recommend any book to almost any people; but this one on Maple Sugar is written in Prof. Cook's happiest style. It is

PROFUSELY ✦ ILLUSTRATED.

And all the difficult points in regard to making the very best quality of Maple Syrup and Maple Sugar are very fully explained. All recent inventions in apparatus, and methods of making this delicious product of the farm, are fully described.

PRICE: 35 Cts., by Mail, 38 Cts.

A Four-Color Label for Only 75 Cts. Per Thousand.

Just think of it! we can furnish you a very neat *four-color* label, with your name and address, with the choice of having either "comb" or "extracted" before the word "honey," for only 75 cts. per thousand; 50 cts. per 500, or 30 cts. for 250, postpaid. The size of the label is 2⅛x1 inch—just right to go round the neck of a bottle, to put on a section, or to adorn the front of a honey-tumbler. Send for our special label catalogue for samples of this and many other pretty designs in label work.
